1.0 INTRODUCTION

Suncor Energy Offshore Exploration Partnership (Suncor), on behalf of its partners Equinor Canada Ltd. and Husky Oil Operations Limited, is proposing an exploration drilling program, referred to as the Tilt Cove Exploration Drilling Project (the Project), on Exploration Licence (EL) 1161, located in the Jeanne d'Arc Basin. Suncor is already an active participant in the offshore oil and gas industry for Newfoundland and Labrador (NL) as the operator of the Terra Nova oil field located on the Grand Banks, 350 kilometres (km) southeast of St. John's. Suncor also holds a 20% working interest in the Hibernia development, a 19.13% working interest in the Hibernia Southern Extension development, a 27.5% working interest in the White Rose development, an approximately 26% in the West White Rose Project, and a 21% working interest in the Hebron project. As a joint venture partner, this places Suncor in the unique position as the only company on the East Coast with interests in all current producing assets.

As operator of the Terra Nova development, Suncor has focused on running safe, reliable, and environmentally responsible operations. Suncor's management approach to the environment includes:

- Suncor's Strategy: The corporate mission is to be trusted stewards of valuable natural resources. A pillar of this corporate strategy is to be an industry leader in sustainable development by continued performance improvements in air emissions, water withdrawals, land reclamation and energy efficiency.
- Suncor's Policy: The Environment, Health & Safety (EHS) policy supports Suncor's mission and strategy. The EHS policy statement is: *We are committed to a culture of operational discipline which is foundational in achieving safety, environmental and health & wellness excellence*.
- Suncor uses the Operational Excellence Management System (OEMS) to identify, avoid, and mitigate operational risks and environmental impacts. This is further described in Section 2.6.

1.1 Project Context and Objectives

Suncor is proposing an exploration drilling program on EL 1161, which will involve drilling up to 12 wells over the term of the EL (2019 to 2028). EL 1161, approximately 300 km from St. John's, NL, is 142,448 net acres (576.5 km^2) and covers water depths ranging from 61 to 87 m. Suncor has a 40% share in EL 1161, along with Husky Oil Operations Limited (30%), and Equinor Canada Ltd. (30%). EL 1161 is located to the west of the Terra Nova and Hebron developments and south of Hibernia. Assuming regulatory approval, the start of drilling would occur in July 2021. Subsequent wells will be considered based on the results of the first well. The objective of the drilling program is to determine the presence, nature, and volume of potential oil and gas resources within EL 1161. It is also consistent with the work expenditure commitments made by Suncor when the licence was issued.

As further discussed in Section 1.3, this Project is considered a designated physical activity under the *Canadian Environmental Assessment Act, 2012* (CEAA 2012). This Project Description serves to initiate the environmental assessment (EA) process, informing regulators of the Project and providing sufficient information to allow the Canadian Environmental Assessment Agency (CEA Agency) to determine whether further assessment, in the form on an Environmental Impact Statement (EIS), is required. Drilling, testing, and abandonment of offshore exploratory wells is considered a designated activity as per Section 10 of the *Regulations Designating Physical Activities,* if it is the first drilling program in an area set out in one or more

exploration licences issued in accordance with the *Canada-Newfoundland and Labrador Atlantic Accord Implementation Act*. This would apply to this Project, as it represents the first exploration drilling program in the area since its designation as EL 1161. The information provided in this document addresses the requirements for a Project Description as outlined in the *Prescribed Information for the Description of a Designated Project Regulations*. As required, a separate Summary of the Project Description has been prepared and submitted to the CEA Agency in both English and French to allow for public review and comments.

1.2 Proponent Information

Suncor is a Canadian energy company; with its head office is located in Calgary, Alberta.

Corporate Head Office - Suncor Energy Inc.
P.O. Box 2844, 150 - 6 Avenue S.W.
Calgary, Alberta, Canada T2P 3E3
T: 403-296-8000
F: 403-296-3030

For the purposes of the EA, the following will serve as the primary contacts:

Greg Janes
Team Lead, Environment & Regulatory
Exploration & Production, East Coast Canada

1.3 Regulatory Context

1.3.1 Accord Acts

Petroleum activities in the NL offshore area are regulated by the Canada-Newfoundland and Labrador Offshore Petroleum Board (C-NLOPB), a joint federal-provincial agency reporting to the federal and provincial Ministers of Natural Resources. In 1986, the Government of Canada and the Province of Newfoundland and Labrador signed the Canada-Newfoundland and Labrador Offshore Petroleum Resource Accord to promote social and economic benefits associated with petroleum exploitation. The federal and provincial governments established mirror legislation to implement the Accord. The federal *Canada-Newfoundland and Labrador Atlantic Accord Implementation Act* and the provincial *Canada-Newfoundland and Labrador Atlantic Accord Implementation Newfoundland and Labrador Act* are collectively referred to as the Accord Acts.

Under the Accord Acts, the C-NLOPB issues licences for offshore exploration and development and is responsible for the management and conservation of offshore petroleum resources, and protection of the environment, as well as the health and safety of offshore workers, while enhancing employment and industrial benefits for Newfoundland and Labrador residents and Canadians.

Offshore petroleum activities and the C-NLOPB's decision-making processes are governed by a variety of legislation, regulations, guidelines, and memoranda of understanding. Exploration drilling programs require an Operations Authorization (OA) under the Accord Acts. Prior to issuing an OA, the C-NLOPB requires the following to be submitted:

- An EA Report
- A Canada-Newfoundland and Labrador Benefits Plan
- A Safety Plan
- An Environmental Protection Plan (including a waste management plan)
- Emergency Response and Spill Contingency Plans
- Appropriate financial security
- Appropriate certificates of fitness for the equipment proposed for use in the activities

For each well in the drilling program, a separate Approval to Drill a Well (ADW) is required. This authorization process involves specific details about the drilling program and well design. There are several regulations under the Accord Acts that govern specific exploration or development activities. There are also various guidelines, some of which have been jointly developed with the Canada-Nova Scotia Offshore Petroleum Board (CNSOPB) and National Energy Board (NEB), which are intended to address environmental, health, safety, and economic aspects of offshore petroleum exploration and development activities. Of particular relevance to the EA of this Project are:

- the Drilling and Production Guidelines (C-NLOPB and CNSOPB 2017)
- the Offshore Waste Treatment Guidelines (OWTG) (NEB et al. 2010)
- the Offshore Chemical Selection Guidelines for Drilling and Production Activities on Frontier Lands (NEB et al. 2009)

1.3.2 Environmental Assessment

As discussed in Section 1.1, offshore exploration drilling can be considered a designated physical activity subject to the requirements of the CEAA 2012 if it falls under the definition provided in Section 10 of the *Regulations Designating Physical Activities*:

> *The drilling, testing and abandonment of offshore exploratory wells in the first drilling program in an area set out in one or more exploration licences issued in accordance with the Canada-Newfoundland Atlantic Accord Implementation Act or the Canada-Nova Scotia Petroleum Resources Accord Implementation Act.*

While seven wells have previously been drilled within the geographic boundaries of EL 1161 from 1973 to 2000, the current Project would represent the first drilling program in this area since being licensed to Suncor as EL 1161. As this Project would constitute a designated physical activity, this Project Description has been prepared to initiate the EA process under CEAA 2012. Once the Project Description is deemed complete, the CEA Agency will conduct a screening process and determine the requirement for an EA. Based on experience with previous exploration drilling projects, it is anticipated that an EIS will be required. The EIS is also expected to satisfy the C-NLOPB requirements for an EA as part of the OA review process under the Accord Acts. Should a federal EA process not be required under CEAA 2012, Suncor will still prepare an EA Report to satisfy C-NLOPB requirements as part of the OA review process.

The Government of Canada introduced Bill C-69 in February 2018, which proposes major changes to federal environmental legislation in Canada. The proposed changes associated with Bill C-69, also known as the *Impact Assessment Act*, are anticipated to come into force as early as mid-2019. Given the timing of the submission of this Project Description, it is anticipated (but not known for certain) that the EA for this Project would proceed under CEAA 2012 even if the *Impact Assessment Act* were to come into force in mid-2019. This would have to be confirmed by the CEA Agency.

1.3.3 Other Regulatory Requirements and Interests

There is no federal funding involved in this Project, but the Project would be carried out on federal lands under the jurisdiction of the C-NLOPB. CEAA 2012 defines federal lands as those lands that include the Exclusive Economic Zone (EEZ) and continental shelf of Canada. As well, as defined by the Accord Acts, the NL offshore area regulated by the C-NLOPB includes the greater of lands within Canada's 200 nautical mile (nm) EEZ or to the edge of the continental margin.

In addition to regulatory requirements pursuant to the Accords Acts and CEAA 2012, the Project is subject to various federal legislative and regulatory requirements, including:

- *Canada Shipping Act*
- *Canadian Environmental Protection Act, 1999*
- *Fisheries Act*
- *Migratory Birds Convention Act, 1994*
- *Species at Risk Act* (SARA)
- *Navigation Protection Act*

The Project Area is within federal lands, which includes the territorial sea of Canada, the EEZ, and the continental shelf. Within offshore NL, different authorities hold jurisdiction over commercial fishing activities that occur either within or outside Canada's EEZ. The Government of Canada holds jurisdiction over management of fisheries for sedentary and non-sedentary species up to the 200 nm limit, and for sedentary species (e.g., snow crab) to the extent of Canada's defined Continental Shelf. Outside of the EEZ, the Northwest Atlantic Fisheries Organization (NAFO) holds jurisdiction over fisheries management for several species and has the authority to designate legally protected areas such as coral closures.

A Migratory Bird Handling Permit will likely be required from Environment and Climate Change Canada (ECCC) to permit the salvage of stranded birds on offshore vessels during the Project.

An EA under the provincial *Environmental Protection Act* is not anticipated as Suncor will not be constructing onshore facilities as part of the Project. Suncor would contract onshore supply base services from an existing base in St. John's, NL. This facility would be operated by a third-party that has the necessary permits and approvals to undertake activities related to offshore oil and gas projects. It is not anticipated that modifications or changes to the existing third-party supply base will be required for the purpose of supporting this Project. In addition, no provincial or municipal permits are currently anticipated to be required for the Project, including for the onshore supply base services.

2.0 PROJECT DESCRIPTION

As described above, Suncor is proposing to drill up to 12 wells on EL 1161 during the term of the EL. The following sections present an overview of the proposed Project, including: the location; components and activities; emissions, discharges and wastes; schedule; potential accidental events; and associated environmental planning and management considerations. Activities associated with the Project are offshore drilling, well testing, well abandonment (or suspension) procedures, and associated supply and service activities. Each of these activities are described in more detail in the following sections and would be similar to the activities conducted for previous exploration drilling projects in the NL offshore area. Geophysical surveys (including vertical seismic profiles (VSP) and wellsite surveys) have not been included in the scope of this Project as Suncor has an EA approval for seismic and geophysical programs through to 2024 under the Environmental Assessment of Suncor Energy's Eastern Newfoundland Offshore Area 2D/3D/4D Seismic Program, 2014-2024 (30006-020-001; C-NLOPB 2015).

2.1 Project Location

EL 1161 is located in the Jeanne d'Arc Basin, west of the Terra Nova and Hebron developments and south of Hibernia (Figure 2-1). Figure 2-1 shows the Project Area, which represents an approximate 40 km buffer around the EL. This area has been defined for EA purposes, recognizing that interactions from Project activities have the potential to extend beyond the EL (e.g. noise attenuation). It is recognized that should an EA be required, the EIS Guidelines would provide guidance on setting spatial boundaries for the EA. The EIS (if required) would also define study area boundaries that will extend beyond the Project Area based on potential environmental interactions with routine and unplanned Project activities and in recognition of potential cumulative environmental effects.

The distance from St. John's to the closest point of the Project Area is 261 km and the distance to the closest point of the EL is 301 km. The nearest community is Blackhead (258 km from the Project Area and 299 km from the EL) on the Avalon Peninsula. The nearest "residences" to the Project would be the Hebron gravity-based structure (GBS) platform 6.6 km away from the eastern boundary of the EL, the Terra Nova floating production, storage and offloading (FPSO) vessel, 7.2 km from the eastern boundary of the EL, and the Hibernia GBS, 11.2 km from the northern boundary of the EL.

Specific well sites are not yet known but drilling operations will be conducted within the defined boundaries of EL 1161.

EL 1161 coordinates from the licence agreement are provided in Table 2.1. Project Area coordinates are provided in Table 2.2.

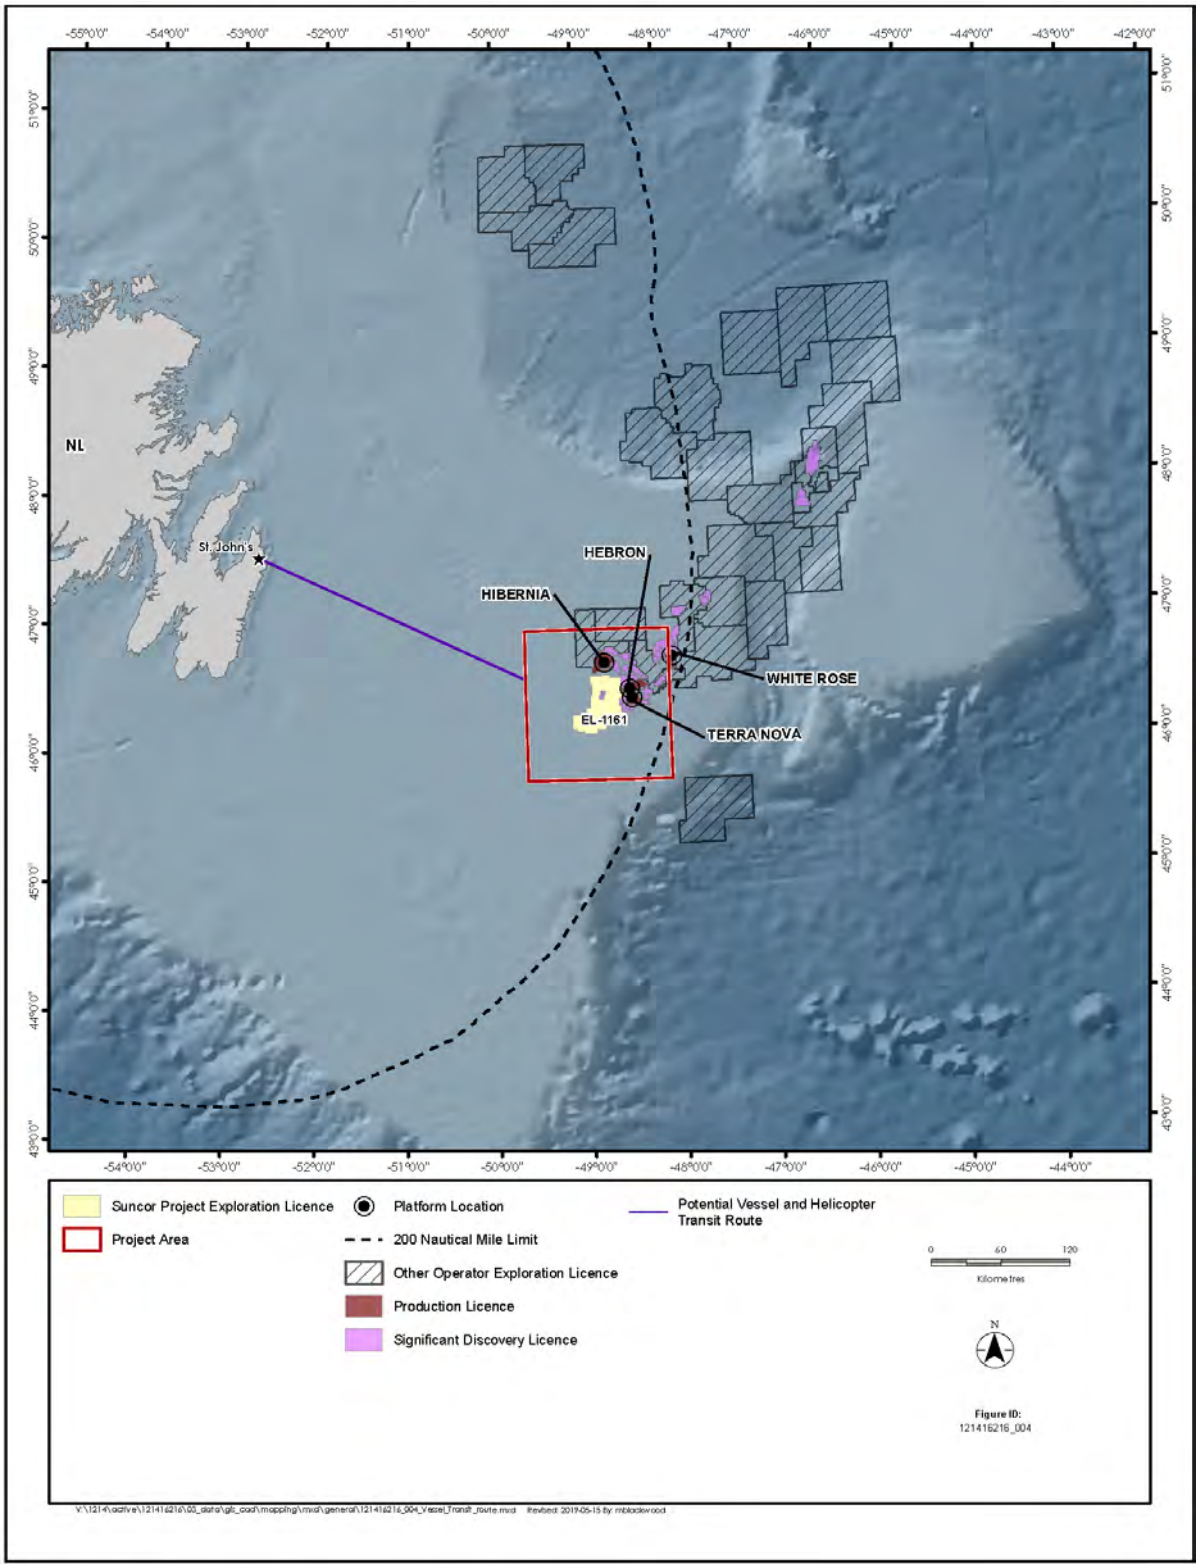

Figure 2-1 Project Area and Potential Transit Route

As previously discussed, seven wells have been previously drilled to date within the boundaries of EL 1161. An eighth well is located within one of the two Significant Discovery Licences (SDLs), which are also located within the geographical boundaries of EL 1161. SDL 1035 and 1036 are both held by Suncor in association with the East Rankin H-21 discovery well. A number of wells have also been drilled to the east and north of EL 1161, as the Hibernia, Hebron, and Terra Nova development projects are located adjacent to the EL and within the boundary of the Project Area. There are no zoning designations that apply to the Project Area. The Project Area does fall within the study area for the Eastern Newfoundland Strategic Environmental Assessment (SEA) completed by the C-NLOPB in August 2014 (AMEC 2014). As well, the Project Area does fall within the study area of the Regional Assessment of Offshore Oil and Gas Exploratory Drilling East of Newfoundland and Labrador, which was initiated in October 2018 under CEAA 2012; however, this assessment is not yet complete.

2.2 Project Components and Activities

The following components and activities are included within the scope of the Project being proposed:

- Drilling
- Well evaluation and testing
- Well abandonment
- Supply and servicing

Suncor's existing environmental approval from the C-NLOPB following the Environmental Assessment of Suncor Energy's Eastern Newfoundland Offshore Area 2D/3D/4D Seismic Program 2014-2024 (LGL Limited December 2013), and the Environmental Assessment of Suncor Energy's Eastern Newfoundland Offshore Area 2D / 3D / 4D Seismic Program 2014-2024 Addendum (LGL Limited August 2015) will be used for authorization applications for 2D / 3D / 4D Marine Seismic, Wellsite / Geohazard Surveys, and VSP activities, as the approved area encompasses EL1161.

In addition, once a specific wellsite has been determined, a survey of the wellsite location will be conducted prior to drilling to inspect the seabed for sensitive habitat (e.g., habitat-forming corals). This is generally conducted by a remotely operated vehicle (ROV). This survey is distinct from the geohazard survey noted above and is included in the EA as part of the Project scope.

2.2.1 Drilling

The wells associated with this Project may be drilled using either a semi-submersible rig or a jackup rig, referred to generically as a mobile offshore drilling unit (MODU). It is considered highly unlikely that a drillship would be used, as this MODU is typically used in deep waters (either on anchor or using dynamic positioning (DP) systems at greater depths) or in areas where increased mobility is required due to ice or other factors and operational risks. Therefore, use of drillships is not considered part of the scope of the Project.

A semi-submersible rig (Figure 2-2) is typically used at moderate depths, such as on the Grand Banks. It is comprised of two longitudinal lower hulls that support several vertical cylinders or columns, which in turn support the main deck of the rig. The hulls and columns are filled with water so that the rig floats, with the main deck sitting above water and the hulls below the surface. Because much of the mass is well below the waterline, semi-submersibles are quite stable in rough seas, thereby providing a relatively stable drilling platform. The rig is generally anchored in place, although some can also stay in position through a DP system.

Source: Amec 2014

Figure 2-2 Typical Semi-submersible Drilling Unit

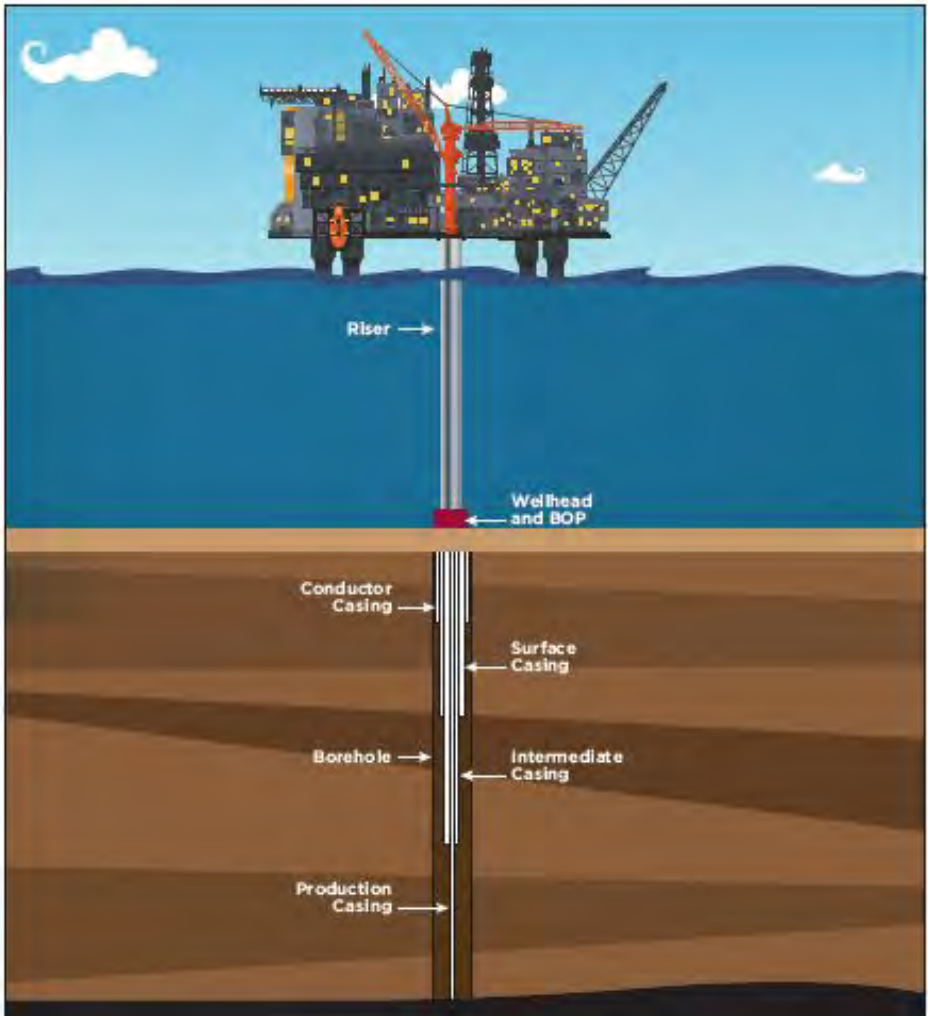
A jackup rig (Figure 2-3) is designed so that the legs can be stationed on the ocean floor and the drilling equipment is jacked up above the water's surface. It therefore provides a stable drilling platform and can be used in waters up to approximately 100 m deep. When their legs are not deployed, jackup rigs float and are generally transported into position through the use of tug boats or submersible barges.

Source: Amec 2014

Figure 2-3 Typical Jackup Drilling Unit

The final selection of a rig will be dependent on rig availability and other factors. Once a rig is selected, rig intake activities will include a rigorous inspection and certification before an OA will be issued by the C-NLOPB.

Exploration wells would be designed for normally pressured reservoirs in the Jeanne d'Arc Formation similar to the adjacent Terra Nova field. Wellbore construction will typically begin with the spud of the well into the seabed and running and setting conductor and surface casing followed by cementing (Figure 2-4). The conductor hole is drilled first, usually to several hundred metres (m) below the seafloor, followed by the surface hole section. When drilling each of these sections, the hole is drilled, the drill string is pulled out and a steel casing is inserted and cemented in place to prevent the wall of the hole from caving in and to prevent the seepage of mud and other fluids while drilling subsequent sections. The conductor casing provides a foundation for subsequent casing strings while the surface casing provides formation integrity to facilitate well control while drilling the next hole.



Source: CAPP 2017
NOTE: For general illustration only, Drilling unit and well components not to scale

Figure 2-4 Schematic of a Floating Rig While Drilling in a Closed Loop Circulating System

During this initial process, drilling is typically done with a water-based mud system (WBM), where drill cuttings, drilling mud, and cement returns from casing cementing will be circulated to the seabed surrounding the wellhead. More information on the management of drilling waste is provided in Section 2.3.3. An unplanned or planned side-track (i.e., drilling perpendicular from an original wellbore) may be drilled to meet the Project objectives.

After cementing the surface casing, the blow-out preventer (BOP) is installed. The BOP is a piece of safety equipment which prevents hydrocarbons from escaping the wellbore into the environment. To install the BOP, it is put in place around the marine riser, which extends from the drill rig to the seabed (Figure 2-4) and lowered to the seabed where it is latched onto the wellhead (Figure 2-4). The riser is the main conduit for remaining drilling activities at depth. Drilling will then resume in a closed loop drilling mud circulation

system. The mud is pumped down the drilling string where it is used to cool and lubricate the bit and to transport cuttings and formation gas back to the rig for geological evaluation. The mud is then processed on the drilling rig and then recirculated back into the well. Drilling parameters including mud volumes will be closely monitored.

As described earlier, Suncor is proposing to drill up to 12 wells over the life of their licence. It is anticipated that it will take up to 120 days to drill a well. During drilling, a safety zone would be established surrounding the rig, as per C-NLOPB regulations. Notice to Mariners would be issued in advance, and Suncor would communicate with commercial fishing representatives with respect to planned dates and locations of rig movements and drilling activities.

2.2.2 Well Evaluation and Testing

If hydrocarbons are discovered during an exploration drilling program, well evaluation and testing would be conducted to help determine the commercial potential of the reservoir. Well evaluation and testing includes wireline logging and formation (well flow) testing, which involves flowing the well fluids through the MODU's test equipment. Well flow testing requires flaring to safely dispose of gases or other hydrocarbons that come to surface. Well flow testing would be conducted over a one-month period (after drilling is complete) on every third well, depending upon the hydrocarbons discovered. Flaring associated with well testing would occur over a 36-hour period.

Well flow testing may be delayed due to rig schedule, anticipated sea states, and weather conditions and occur at a later date. In the event of a delayed well flow test, Suncor will secure and suspend the well with required barriers in place prior to moving the drilling rig off location. Well testing will be subject to Suncor's well test assurance process, which is designed to promote safe and efficient well test operations.

2.2.3 Well Abandonment

Upon acceptable evaluation of the well for hydrocarbons and upon C-NLOPB approval, the well will be suspended or permanently abandoned. An abandonment program will be executed using a configuration of cement and permanent mechanical bridge plugs, placed at strategic depths in the wellbore to separate and permanently seal off zones of varying ages and pressures. This process isolates these zones from each other and prevents subsurface fluids from escaping from the wellbore in the future.

As a minimum, the requirements of Part 6 of the *Newfoundland Offshore Petroleum Drilling and Production Regulations*, related to well termination will be met, along with relevant requirements of the *Drilling and Production Guidelines*. This includes the requirements to suspend or abandon a well in a way so that it can be easily located and left in a condition that isolates hydrocarbon bearing zones and discrete pressure zones, and prevents formation fluid from flowing through or escaping from the well-bore. If the well is suspended, Suncor will monitor and inspect the well to maintain its continued integrity and to prevent pollution until it's properly abandoned.

As part of well abandonment, there is a requirement for operators to clear the seafloor of material or equipment that might interfere with other commercial uses of the seabed. During this last stage of the abandonment process, the wellhead will be removed from the seabed depending on consultation with

regulators. If determined that the wellhead needs to be removed, the preferred method is a mechanical cutter that can cut the wellhead below the seabed and then be retrieved to surface.

2.2.4 Supply and Servicing

Supply vessels and helicopters are used to transport personnel, equipment, and materials to and from the MODU during an offshore drilling initiative according to work schedules and rotations, workforce numbers, distances, and other factors. Supply vessels typically make regular trips to the drilling unit throughout a drilling program, and a dedicated stand-by vessel will attend to the rig.

As with all offshore projects in this region, logistics and service requirements for a drilling rig can be challenging especially during seasons of heavy weather, fog, Arctic ice, and sea states. Helicopter and vessel support for the Project would originate in St. John's, from third-party suppliers operating from existing licenced / permitted facilities. While the rig is on location, a dedicated stand-by vessel will be stationed near the rig for emergencies and for secondary storage of well tubulars and drilling mud if required. A second vessel will be servicing the rig by transporting equipment and people (in the event helicopters cannot fly) to and from the rig. It is anticipated that two to three sailings per week will be required, but more is possible if a rig crew change is required. Similar to the drilling rig, supply vessels will need certification and approval in order to work in Newfoundland waters.

Helicopter support will be from St. John's and will be the primary method to transport personnel to and from the rig. If helicopters cannot fly because of poor visibility from fog or from high winds, consideration will be given to transport by vessel depending on the long-term weather forecast and the urgency to get people to the rig. Emergency response, safety procedures, and protocol will be in place for transport of personnel offshore.

Figure 2-1 illustrates the potential transit route for Project vessels. The oil and gas industry has established communication and cooperation methods with other marine users, primarily commercial fisheries, to coordinate vessel traffic. The specific route taken by an individual vessel between the St. John's base of operations and the Project site would be the safest, most efficient route available at that time.

2.3 Emissions, Discharges, and Waste Management

Emissions, discharges, and wastes will be managed and disposed of according to regulatory requirements and applicable guidelines, with efforts being made to reduce emissions and discharges generated during the Project. The following subsections provide a description of atmospheric emissions, underwater sound, drilling waste, liquid discharges, and hazardous and non-hazardous solid wastes that are likely to be generated over the course of Project activities and how these wastes will be managed. In general, offshore waste discharges will be managed in compliance with the International Convention for the Prevention of Pollution from Ships (MARPOL) and/or the OWTG, as applicable. Wastes brought to shore for disposal will be managed in accordance with the provincial government's *Newfoundland and Labrador Waste Management Strategy* and other applicable regulatory requirements (including municipal by-laws). A Waste Management Plan will be prepared by Suncor as part of the OA application process with the C-NLOPB prior to drilling operations.

2.3.1 Atmospheric Emissions

During Project activities, atmospheric emissions would be created by the combustion of marine fuel by the MODU and supply vessels, and by short-term flaring during well testing, if testing is performed. Emissions would include carbon monoxide (CO), carbon dioxide (CO_2), sulphur dioxide (SO_2), nitrogen oxides (NOx), and particulate matter (PM). Suncor will comply with the provincial *Air Pollution Control Regulations*, Ambient Air Quality Objectives under the *Canadian Environmental Protection Act*, regulations under MARPOL, and the intent of the Global Gas Flaring Reduction Partnership (which seeks to increase the use of associated natural gas and thus reduce flaring and venting).

With respect to greenhouse gas (GHG) emissions, it is estimated that there could be approximately 497 tonnes of carbon dioxide equivalent (CO2e) emissions associated with operational drilling and vessel traffic per day over the program. Project GHG emissions are estimated to be 59,593 t CO2e per year. These estimates are based on a maximum of 12 wells being drilled with up to 1,412 days of drilling over the program. These emissions represent 0.6% of the total reported provincial GHG emissions for 2016 (10,800,000 tonnes CO2e) and 0.01% of the national emissions (704,000,000 tones CO2e) (ECCC 2017). If well flow testing is conducted, flaring will result in additional GHG emissions. Assuming 4 well flow testing events over the life of the Project, it is estimated that an additional 122,742 tonnes of CO2e could be emitted.

Suncor (2018a) has a corporate GHG emission goal of reducing their emission intensity of the production of oil and petroleum products by 30% (based on 2014 emissions) by 2030 from harnessing changes in technology and making improvements by innovation. To achieve this goal, Suncor is annually investing approximately $200 million to support research and technology development (Suncor 2018b). While the corporate reduction goal is 30%, each of Suncor's diverse operating assets assesses and develops asset specific reduction strategies (e.g., 5%, 25%) in support of the overall company GHG emission goal.

Navigation and deck lighting from the MODU and supply vessels will create artificial light emissions. While Suncor can strive to reduce these emissions, they would only be reduced to the extent that worker and vessel safety are not compromised. In the event of flaring during well testing, there will be temporary (e.g., up to two or three days) light and thermal emissions associated with the flare. These emissions will be reduced through use of a water curtain.

The MODU, supply vessels, and helicopter traffic will generate noise; however, given the distance of the MODU offshore, the potential for interaction with human receptors would be limited. Supply vessels and helicopters will also operate out of existing port and airport facilities, generating sound comparable to existing traffic. Underwater sound is discussed in Section 2.3.2.

2.3.2 Underwater Sound

Underwater sound would be generated continuously by the MODU during a drilling program, with levels dependent on the type of drilling vessel (e.g., semi-submersible versus jackup rig) and method of positioning on station (e.g., use of thrusters for DP versus anchoring). Underwater sound would also be generated by supply and standby vessels. In general, the propagation of underwater sound would be dependent on several factors including water column and seabed characteristics. The Project Area includes

a 40 km buffer around the EL to encompass the area of potential sound interactions, as per previous project assessments in the region.

2.3.3 Drilling Waste

Drilling muds are an essential component of drilling operations. Drilling muds are the fluids which lubricate and cool the drill bit and hole, circulate cuttings and carry them back to the surface, and help to maintain appropriate hydrostatic pressure in the well to overbalance formation pressure, providing the primary barrier for well control (BOP forms part of the secondary barrier). Different types of drilling muds will be used for different sections of the well.

WBMs will be used for the riserless sections of a well. WBMs are primarily composed of seawater, with other additives including bentonite (clay), barite, and potassium chloride. Other approved chemicals are also added as required to achieve and control the required mud properties. During this initial drilling, mud and cuttings will be returned to the seabed where they will accumulate near the wellhead. The discharge of WBM cuttings at the seabed, while drilling the first two-hole sections, is accepted as industry standard practice and is consistent with the OWTG. Spent and excess WBM may be discharged from the drilling vessel without treatment as per the OWTG.

Synthetic-based drilling muds (SBMs) are generally used to drill the deeper (lower hole) sections of the wells, once the riser has been installed. The marine riser, connecting the MODU to the well, allows for the return of drilling mud and cuttings back to the MODU, where cuttings can be treated to meet the requirements of the OWTG prior to disposal to the seabed. Specifically, the drilled cuttings and drilling mud are separated and cleaned using solids control equipment. Initially, the mud returns carrying the drilled cuttings pass through a shale shaker, where most of the mud is separated from the cuttings. Where SBM are used, cuttings from the shale shaker pass through a cuttings dryer, which removes SBM from cuttings. Residual synthetics-on-cuttings discharged to the marine environment is treated in accordance with the OWTG prior to discharge. Monitoring of the residual base mud-on-cuttings levels is carried out during well sections involving use of SBM. After recovery and treatment of drill muds, the drill cuttings are discharged from the drilling vessel at the well site. No surplus SBM is discharged to the sea; spent SBM that cannot be reused during drilling is brought to shore for disposal in an approved licensed facility.

Drilling cement is pumped into the casing / wellbore annuli after the casing is installed. Prior to installation of the marine riser and BOP, excess cement is discharged on the seabed surrounding the wellhead. Cement returned to the drilling unit will be transported back to shore and disposed of at an appropriate facility. During commissioning and testing of a cement unit, small volumes of cement may be discharged into the sea.

2.3.4 Liquid Discharges

Liquid wastes generated from the MODU and/or the supply vessels may include:

- Produced water (if well testing is conducted)
- Bilge and deck drainage water
- Ballast water
- Grey / black water (sewage)

- Cooling water
- Well treatment fluids
- Fire control testing water
- BOP fluid

The OWTG specifies allowable chemical properties for offshore disposal to the marine environment and associated reporting requirements, including in some cases, required sampling and analysis prior to ocean discharge. Where discharges occur offshore, the points of discharge will be below the water surface. Liquid discharges that do not meet OWTG performance targets for ocean disposal are transported back to shore for disposal at an approved licensed disposal facility.

2.3.5 Hazardous and Non-Hazardous Solid Wastes

Hazardous and non-hazardous solid wastes will also be generated by Project activities. Nonhazardous wastes may include domestic waste, scrap metal, recyclables, and other miscellaneous non-hazardous wastes. Hazardous wastes (including waste dangerous goods) could include oily waste (filters, rags, waste oil), waste chemicals and containers, batteries, and biomedical waste. Food wastes and domestic sewage will be macerated in accordance with the OWTG and MARPOL prior to discharge at sea (below the water surface). Other solid waste generated offshore will be transported to shore for appropriate treatment and/or disposal in accordance with applicable regulations and municipal by-laws.

Suncor will retain a third-party licensed waste management contractor to manage and dispose of wastes transported onshore. Hazardous wastes will be stored in dedicated and appropriate waste receptacles and then disposed of at approved facilities in compliance with applicable regulations and approvals.

2.4 Project Schedule

Suncor proposes to commence exploration drilling with an initial well in July 2021 with subsequent wells, if the first exploration well is successful. Up to 12 wells could be drilled over the term of the EL (2019 to 2028), contingent on the drilling results of the initial well. Drilling activities will not be continuous and will be in part determined by rig availability and previous wells' results. The length of drilling associated activities may be up to 120 days for each well with the potential to occur year round.

Well abandonment will likely be conducted following drilling and/or well flow testing. Wells may be designed for suspension and re-entry, but this will be determined through further prospect evaluation.

2.5 Potential Accidental Events

Potential accidental events that could occur during exploration drilling and potentially result in a release to the environment, include vessel collision, dropped objects, loss of well control (e.g., blowout), and spills and releases from MODU or supply vessels. Multiple preventative and response barriers are put in place to manage risk, both in terms of the incident arising in the first place, and to mitigate and respond to incidents to manage potential consequences. Suncor has an Oil Spill Response Plan (TN-IM-EV03-X00-004, M9) filed with the C-NLOPB; this document is reviewed every three years to incorporate new response technologies that may become available (e.g., use of dispersants). The Oil Spill Response Plan outlines

Suncor's objectives and approach, response strategy, the three tiers of response management, response countermeasures, waste storage and disposal, training and exercises, and regulatory considerations. This Plan would be reviewed and updated as needed to address activities associated with the proposed Project.

Suncor will use predictive spill modelling to help assess the risk of adverse environmental effects that might occur as a result of potential accidental events associated with the Project. Oil spill modelling will include water depth and metocean conditions within the proposed drilling area, which would affect the behaviour of a subsea spill scenario. Modelling is conducted as an unmitigated accident (i.e., no spill response measures are applied for the duration of the spill). Residual effects of an accidental event spill are assessed after the application of mitigation measures.

Results of recent oil spill modelling originating from within the adjacent Terra Nova field, is consistent with other spill model results originating from within the Jeanne d'Arc Basin, in that the model predicted spilled oil would be swept by currents and wind primarily from the east to the south until it gradually dispersed, diffused or evaporated. Based on recent spill modelling conducted for various exploration drilling projects in the area, similar effect assessments will be conducted.

The EIS (if required under CEAA 2012) will also provide an overview of Suncor's overall oil spill preparedness and response capability which will include a range of specific response measures such as offshore containment and recovery, chemical dispersant use, in situ burning, shoreline protection and oiled wildlife response.

2.6 Suncor's Operational Excellence Management System

The execution of the Project will be conducted in a manner consistent with Suncor's OEMS, which is Suncor's enterprise-wide management system that organizes and links standards, systems and processes required to manage operational risks, prevent and mitigate environmental impacts and deliver safe, reliable operations. OEMS is based on the Plan-Do-Check-Act continual improvement cycle and follows the internationally recognized management system standards and specifications ISO 14001 and 9001.

The OEMS sets high-level, company-wide mandatory management system requirements with respect to the foundational non-financial risk management processes necessary for a business to achieve operational excellence. Each element of Suncor's OEMS describes the company-wide requirements and expectations for managing operational and asset integrity risks inherent in the business.

Each business area within Suncor accepts responsibility for managing the impact of its activities and products on people, the environment, property and corporate assets. To accomplish this, senior leaders in each organizational and functional unit must:

- develop, implement and maintain appropriate systems, processes, procedures and tools to enable organizational units to meet the OEMS requirements
- understand the operational risks associated with its activities and products
- regularly report performance against defined objectives and specific performance measures
- seek input and feedback from internal and external stakeholders

- self-assess and audit the integrity and effectiveness of its systems against OEMS requirements
- identify opportunities for continual improvement

Risk factors and business requirements within some of Suncor's organizational units will require the development and implementation of issue-specific, dedicated systems, programs and models such as:

- Process Safety Management Program - systems and controls that ensure process hazards are identified, understood and controlled
- Suncor's Asset Development and Execution Model - a framework for consistent development, and sustainment of physical assets consisting of an integrated 5-stage gate process supported by solid project governance
- Suncor's Well Delivery Model - the end-to-end process that takes well planning developed as part of the Evaluate Exploration Acreage or Evolve Life of Field Concepts processes and delivers either a new or modified or abandoned well
- business unit or business area specific management systems (e.g., East Coast Management System Manual (OD-PE-QM04-X00-001)
- programs to ensure the effective implementation of Operational Excellence during non-routine projects

Through OEMS, Suncor has implemented numerous measures intended to reduce the environmental, health, safety, navigational and aesthetic impacts. Examples of these programs include but are not limited to:

- completion of regulatory consultations to ensure regulatory expectations and requirements are understood and implemented into project planning, including obtaining necessary regulatory authorizations and permits
- development and implementation of Environmental Protection Plans for Suncor's East Coast operations that include procedures relating to chemical management, effluent discharges, waste management, seabird handling / release and rehabilitation, oil spill response, fisheries liaison, compensation and monitoring.
- development and implementation of a Safety Plan that outlines organizational structure, roles and responsibilities, risk management procedures, legal and other requirements, environmental and health and safety commitments, goals and targets, management of change, learning and competence, contractor management including vessel selection and audit process, emergency management and response procedures, quality management processes, bridging processes to contractor management systems, diving procedures, vessel mobilization procedures and safety meetings
- completion of risk management processes such as Process Hazard Analyses and Hazard Identification and Risk Assessment before the project mobilizes for the offshore phase
- implementation of emergency management procedures relating to oil spill response, crisis management, operational emergencies, security and business continuity
- implementation of simultaneous operations procedures to ensure identification of Terra Nova Field control and coordination of vessels working in and around the Field
- placement of Suncor Company Representatives on project vessels to ensure project oversight and effective implementation of Suncor policies and procedures, including OEMS

3.0 ENVIRONMENTAL SETTING

This section describes the existing biophysical and human environments that overlap and may interact with the proposed Project. The biophysical environment includes geology and topography of the Project Area, climate, oceanography, air quality, fish and fish habitat, marine birds, marine mammals, and special areas. The human environment includes commercial and Indigenous fisheries, Indigenous communities and other human components and activities that characterize the Project Area.

3.1 Physical Environment

3.1.1 Geology, Topography, and Seismicity

The geology of the Eastern Newfoundland Offshore Area is complex and dynamic. The bedrock and surficial geology of the Grand Banks have been shaped by various natural and human factors and processes over time (AMEC 2014).

The Project is located in the Jeanne d'Arc Basin, in the offshore region of the Newfoundland continental margin and comprises primarily Mesozoic rocks, with water depths ranging from 61 m to 87 m. This area formed during the latest Wilson cycle, which was initiated during the Late Triassic and involved tectonic activities resulting in the breakup of Pangea and opening of the Atlantic Ocean. These episodes of rifting and seafloor spreading heated the continental crust and lithosphere and then subsided to form a complex set of marginal Mesozoic basins, subbasins, troughs, and sediment ridges. The extensional system is bounded in the north by the Dover Fault and Charlie Gibbs Transform Fault and in the south by the Newfoundland-Gibraltar Transform (Enachescu 2011, in Amec 2014). The resulting combination of stratigraphy, structure, and timing has been conducive to hydrocarbon generation and entrapment (Bell and Campbell 1990, in AMEC 2014).

The Eastern Canadian continental shelf has been strongly influenced by Quaternary glaciation, which resulted in an erosional morphology. Most of the glacial deposits on the shelf are recessional, with till sheets overlain by proglacial silts (Piper 1991). The main seabed formation in the vicinity of the Project is Grand Banks Sand and Gravel. Grand Banks Sand and Gravel is the youngest of the formations in the eastern NL offshore. It is a basal transgressive deposit. It was formed by coastal and shallow water processes during the last shoreline transgression, and occurs typically at water depths shallower than 100 m. This formation is a clean, free-draining, well-sorted material ranging from uniform fine sand to gravel-sized components (Amec 2014).

Eastern Canada is located within a relatively stable area of the North American Plate, where there has been a relatively low level of recorded seismic activity. Each year, approximately 450 earthquakes occur in Eastern Canada, with the majority having magnitudes between two and three. Along Canada's eastern continental margin, instrument-recorded earthquake epicentres are concentrated in a few areas of relatively intense seismic activity, such as the Laurentian Slope (Amec 2014). Natural Resources Canada (NRCAN) reviews earthquake probability across Canada and have classified the Jeanne d'Arc Basin as having a low to moderate seismic hazard (NRCAN 2013).

3.1.2 Climate

The Project Area experiences weather conditions typical of a marine climate with good or fair visibility. Annually, prevailing winds are southwesterly and westerly. Gale force winds (17.5 to 24.2 m/s) occur in all months of the year, and storm force winds (24.7 to 32.4 m/s) occur in all months except May through July (Amec 2014). The surrounding waters have a moderating effect on temperature and air temperatures are coolest in February and warmest in July. Most precipitation is in the form of rain and snow, with some mixed rain and snow, freezing rain, hail. Most rain occurs in October and November, with peak snow fall in January and February. There is potential for thunderstorms year-round, with highest frequency of occurrence in July and August (Amec 2014).

3.1.3 Waves and Ocean Currents

The most severe sea states on the Grand Banks occur between December and February, peaking in February when maximum significant wave heights of up to 13.3 m from the southwest are expected. Lowest significant wave heights occur in July (6.0 m). Significant wave heights of 6 m or more are expected to occur during every month (Amec 2014). Sea surface temperatures generally average about 0°C in February to 14°C in September (Amec 2014).

Circulation in the vicinity of the Project is dominated the Labrador Current and the North Atlantic Current. The main current in region is the Labrador Current, which consists of two streams; an inshore branch which transports sub-polar water to lower latitudes along the Continental Shelf of Eastern Canada and an offshore branch that flows along the outer edge of the Grand Banks (Amec 2014).

3.1.4 Air Quality

The existing ambient air quality within the Project Area can be generally categorized as good, with occasional exposure to exhaust products from existing offshore oil production facilities (i.e., Terra Nova, Hebron, Hibernia, and White Rose), supply ships, and other vessels in the area. This region also receives long-range air contaminants from the industrial mid-west and northeastern seaboard of the United States (ExxonMobil Properties Canada 2011).

3.2 Biological Environment

3.2.1 Marine Fish

A variety of fish species occur in offshore Newfoundland. Commercially important fish species that exist in the vicinity of the Project include yellowtail and witch flounder, roughhead and roundnose grenadier, Atlantic and Greenland halibut, skate, capelin, and mackerel (Amec 2014; Suncor 2017). While American plaice and Atlantic cod were historically abundant, they are currently under moratoria, as are redfish (in 3LN) and witch flounder (in 3NO). Non-commercial fish species commonly found in the vicinity of the Project include sand lance, Arctic cod, sculpin, and alligatorfish (Husky Energy 2012). By-catch recorded during EEM programs conducted from Fisheries and Oceans Canada (DFO) research vessels (2002 to 2008) recorded snow crab, shrimp, Atlantic cod, Arctic cod, capelin, American plaice, yellowtail flounder, witch flounder, squid, Iceland scallop, sand lance, thorny skate, sea star, sculpin, snakeblenny, toad crab, alligatorfish,

seasnails, sea urchin, sand dollar, eelpouts, radiated shanny, and spiny lumpfish (Suncor 2010). The status of marine fish species at risk are listed in Section 3.2.4.

The benthic species in the vicinity of the Project include various species of polychaete worms (the dominant in faunal or infauna group of organisms (DeBlois et al. 2014a), amphipods, echinoderms, cumaceans, and clams (DeBlois et al. 2014a; Suncor 2017b); the same species have been found in the Hebron field (Stantec 2016). Corals are limited in the vicinity of the Project due the predominantly sandy substrate (Deblois et al. 2014a).

Suncor has conducted EEM programs since production began at the Terra Nova field in 2000. Nine collection and reporting cycles have been conducted from 2000 to 2014 (the report on the 2017 cycle is not yet public). The EEM program includes a sediment and water component. Key findings include:

- the dispersion of drill cuttings in the Project Area was consistent with model estimates (Seaconsult 1998) (i.e., fines content decreases with distance from drill centres) (DeBlois et al. 2014a)
- sediment contamination decreased in direct response of reduced drilling (DeBlois et al. 2014a)
- sediment quality triad results (contamination, toxicity and benthic biota effects) indicated reduced sediment quality at one station less than 150 m from a drill centre in some sampling years
- effects on some benthic invertebrate biota (abundance, biomass, richness, diversity, toxicity to laboratory amphipod cultures) were detectable 1 to 2 km from drill centres in some sampling years but such effects were weak or absent beyond less than 150 m from drill centres (Paine et al. 2014)

3.2.2 Marine Mammals

Approximately 20 species of marine mammals (including whales, dolphins, porpoises, and seals) are known to occur in the vicinity of the Project. Species observed during seismic surveys conducted in the Jeanne d'Arc Basin include humpback whale, sei whale, fin whale, minke whale, long-finned pilot whale, common dolphin, Atlantic white-sided dolphin, white-beaked dolphin, harp seal (ExxonMobil Canada Properties 2011). Many marine mammal species feed in the area on a seasonal basis, with highest numbers occurring in the summer and fall (Husky Energy 2012), although some species such as minke and humpbacks whales may occur year-round. Harp and hooded seals that use ice as an overwintering and whelping area may occur within the Regional Area during years with heavy pack ice conditions (DFO 2000, in Amec 2014). Marine mammal and sea turtle species at risk are listed in Section 3.2.4.

3.2.3 Marine and Migratory Birds

The Grand Banks provide important habitat for millions of marine birds, representing over 60 species (Husky Energy 2012). Species observed in the vicinity of the Project include gannets, phalaropes, gulls, petrels, alcids, and shearwaters (Amec 2014). Many of the pelagic seabirds are resident in the region year-round (such as northern fulmar and black-legged kittiwakes (ExxonMobil Canada Properties 2011)), with their numbers supplemented by the many migratory birds that use the area to forage and breed in summer. For example, most of the world's population of greater shearwater migrate to moult and feed during summer months and Leach's storm-petrel migrate from coastal colonies (ExxonMobil Canada Properties 2011). July to September represents the peak seabird density, large numbers of which occur on the shelf edges (Lock et al. 1994, in LGL Limited 2008). Migration south for the winter reduces the densities of seabirds during the fall and winter (Fifield et al. 2009, in Amec 2014), although hundreds of thousands of birds do use the Grand Banks during winter (ExxonMobil Canada Properties 2011).

An on-board observer on the Terra Nova FPSO, located approximately 7 km from the eastern edge of EL 1161, conducted seabird observations for Suncor in the Terra Nova field as per the Eastern Canada Seabirds at Sea (ECSAS) program protocol. During January 1, 2017 to December 31, 2017, a total of 11,730 individual seabirds were recorded during 732 seabird observation sessions (Table 3.1). Poor visibility (≤1 nm) in poor weather conditions (rain, snow, mist, or fog) resulted in no seabird sightings in 20% of observations. No seabirds were recorded in approximately 43% of the observations. Approximately 31% of birds sighted were black-legged kittiwake; great black-backed gulls were the second-most commonly sighted birds (approximately 28%) (PAL Aerospace 2018). Leach's storm-petrel were observed during September. The number of different bird species observed offshore from the Terra Nova FPSO increased in the last quarter of the year due to the migration of birds south for the winter.

Migratory Bird Sanctuaries (MBSs) and Important Bird Areas (IBAs) are described in Section 3.2.5. Marine and migratory bird species at risk are listed in Section 3.2.4.

3.2.4 Species at Risk

SARA is the means through which designation and protection to rare, endangered and threatened species are provided in Canada. Table 3.2 provides an up-to-date tabular summary of those species both designated under SARA and by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC). None of the species have SARA-designated critical habitats designated in the vicinity of the Project.

3.2.5 Special Areas

Several marine and coastal areas off Newfoundland and Labrador have been designated as protected under provincial, federal, international and/or other legislation and processes, or have been formally identified through relevant forums and processes as being otherwise special or sensitive due to their ecological, historical and/or socio-cultural characteristics and importance. These areas are shown in Figure 3-1, with the corresponding detail provided in Table 3.3. Seamounts and aggregations of corals and sponge are depicted in Figures 3-2 and 3-3, respectively.

The Project Area overlaps with two special marine areas: Snow Crab Conservation Exclusion Zone for Crab Fishing Area 8BX and a significant benthic area (SBA) for large and small gorgonian corals. Closed areas in the snow crab fishery have been established through consultation using a co-management approach with fleet committees in various crab management areas throughout the region (DFO 2011). SBAs are defined in DFO's Ecological Risk Assessment Framework (ERAF; DFO 2013) as "significant areas of cold-water corals and sponge dominated communities", where significance is determined "through guidance provided by DFO-lead processes based on current knowledge of such species, communities and ecosystems" (Kenchington et al. 2016). SBAs are not formally protected under any federal legislation but are a key variable in determining vulnerable marine ecosystems, which may be designated in the future.

The transit route to the shorebase in St. John's has the potential to cross the Virgin Rocks and Eastern Avalon EBSAs (Ecologically and Biologically Significant Area). The current boundary of the EBSAs as presented on Figure 3-1 are outdated; however, DFO has not yet publicly released updated areas for 2019. Based on discussion with DFO, the geographic extent of the Virgin Rocks and Eastern Avalon EBSAs will change, but no new EBSAs are defined along the proposed transit route. The transit route will also cross Snow Crab Conservation Exclusion Zone for Crab Fishing Area 6C.

3.3 Human Environment

3.3.1 Commercial and Indigenous Fisheries

Fisheries are an important component of the socio-economic environment of Newfoundland and Labrador and other parts of Canada, including the various communities and regions that extend along the coastline of eastern Newfoundland who participate in commercial fishing as a source of economic stimulus to the local economy. Commercial fisheries in this region are diverse, and involve a range of target species, use of various gear types, and occur at higher intensities at certain times of the year. The region of the Grand Banks in which the Project Area is located is not heavily fished but is located between two historically heavily fished areas including the Inner Grand Banks and the Slopes of the Grand Banks and Flemish Pass (Figure 3-4).

Commercial fisheries data for domestic harvesting are provided by DFO Statistical Services in Ottawa, ON, including landings (weight and value) statistics and geospatial information illustrating the overall location and timing of fishing activity. The mapping information is provided by DFO as an aggregated data set which gives a general indication of fishing areas (by species, gear types and other pre-determined categories and data classes) for individual grid “cells” that are approximately 6 x 4 nm in size.

EL 1161 straddles NAFO Unit Areas 3Lr and 3Lt, which account for approximately 4% of the total weight and 6% of the total values of commercial fisheries in NAFO Division 3L (Table 3.4). Data from DFO suggests that commercial fishing within the Project Area did not occur in 2012, 2013 or 2014, but did occur in 2015 for snow crab (harvested using pots). In 2016, commercial fishing activity for snow crab (pots) was recorded, along with Stimpson’s surf clam, cockle, and shark.

Species that have been historically harvested for commercial purposes in eastern offshore Newfoundland and Labrador include snow crab, northern shrimp, Greenland halibut, Atlantic halibut, Atlantic cod, American plaice, redfish, and flounder (yellowtail and witch). Fisheries for pelagic species such as capelin and mackerel do occur in offshore Newfoundland and Labrador but are located closer to the coast and nearshore areas. Commercial fisheries for large pelagic species, such as swordfish, shark and tuna, and for invertebrates, such as clams and scallops also occur, but on a smaller scale than those for crab, shrimp, and groundfish.

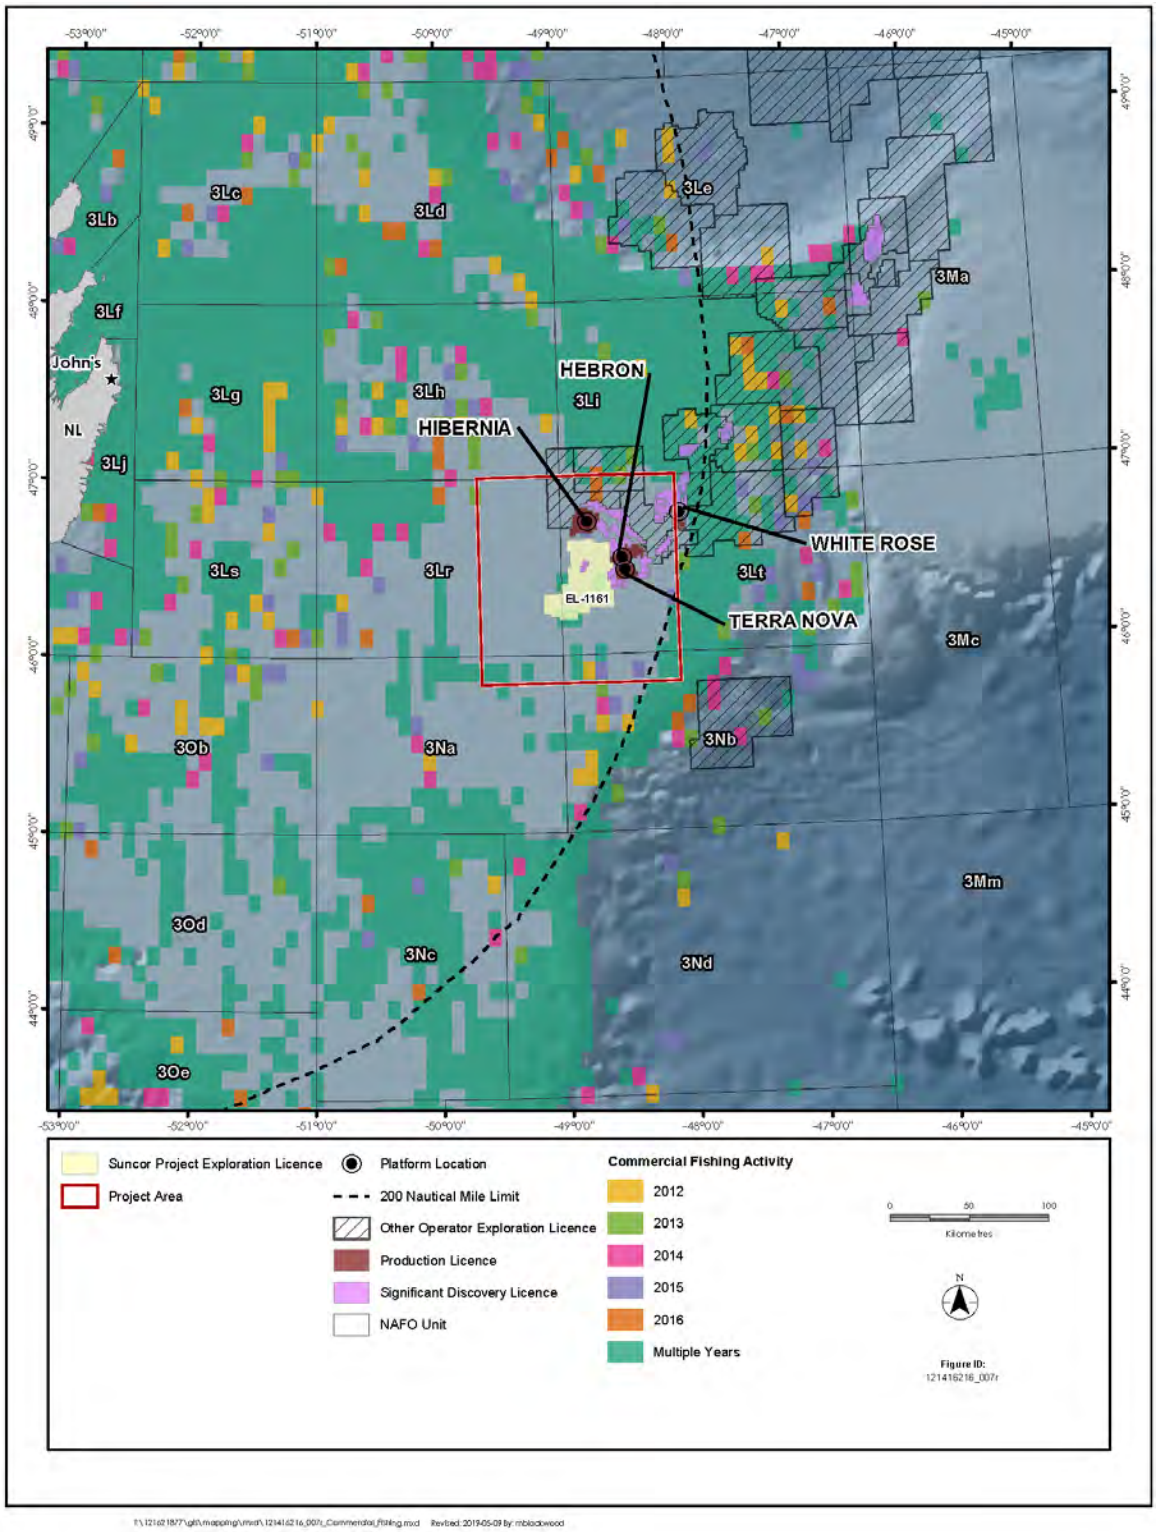

Figure 3-4 Commercial Fishing Activity in the Project Area and Surrounding Areas (2012 to 2016)

Table 3.4 Weigh and Value of Commercial Fishing within NAFO Division 3L

NAFO Units Area	Weight (kg)		Value (CAD)

Several Indigenous groups have commercial communal fishing licences in the Project Area or surrounding areas. A summary of commercial communal fishing licences issued under the Aboriginal Communal Fishing Licences Regulations is provided in Table 3.5. There are no food, social, and ceremonial (FSC) fisheries in the Project Area, or in surrounding areas. The closest FSC fishery in Newfoundland and Labrador is a multi-species coastal fishery undertaken by Miawpukek First Nation (MFN) in Conne River, 480 km to the northwest of the Project Area (CNOOC Petroleum North America ULC; formerly Nexen Energy ULC [Nexen] 2018).

Table 3.5 Commercial Communal Fishing Licences Issued to Newfoundland and Labrador Indigenous groups in the Project Area and Surrounding Areas

Group	Commercial Communal Fishing Activity
Nunatsiavut Government	The Nunatsiavut Government hold several commercial communal licences for groundfish, Greenland halibut, seal, scallop, snow crab, shrimp and Arctic char. Groundfish licences are held for NAFO Divisions 2GHJ, 3KL and Greenland halibut may be harvested in 2+3K and 3LMNO (Nexen 2018). Seal licences permit harvesting in Sealing Areas 4 through 33, Atlantic-wide. Scallop licences are issued for Scallop Area 1 off the coast of Northern Labrador, and snow crab licences are issued for Snow Crab Areas 1 and 2 and an Exploratory licence for NAFO 2H. Northern shrimp licences are held for Shrimp Areas 4 and 5. The Nunatsiavut Government also has a commercial communal Arctic char licence for the area from Cape Rouge to Cape Chidley in Northern Labrador.

Table 3.5 Commercial Communal Fishing Licences Issued to Newfoundland and Labrador Indigenous groups in the Project Area and Surrounding Areas

Group	Commercial Communal Fishing Activity
Innu Nation	Innu Nation holds several commercial communal licences for groundfish, mackerel, capelin, shrimp, and halibut. Innu Nation hold licences for groundfish in NAFO 0, 2GHJ, 3KL, groundfish (mobile gear) in NAFO 2GHJ, 3KL, mackerel and capelin in Fishing Areas 1 to 11, and shrimp in Shrimp Area 4. Ueushuk Fisheries Limited hold a mid-shore groundfish licence for various areas for harvesting of a variety of species. Ueushuk Fisheries Ltd. also hold a shrimp licence for Shrimp Areas 6 and 7.
NunatuKavut Community Council (NCC)	The NCC holds several commercial communal licences for groundfish, shrimp, snow crab, capelin, herring seal, scallops, and toad crab. NDC Fisheries (Nunacor) also holds several commercial communal licences and operates enterprises for groundfish in NAFO 2GHJ, 3KL, and 4RS, scallop in Scallop Areas 1 and 2, shrimp in Shrimp Area 6 as well as for whelk, northern shrimp, snow crab, capelin, herring and toad crab in southern Labrador. The NCC also holds two seal harvesting licences in Seal Fishing Areas 4 to 33 (Atlantic-wide).
Miawpukek First Nation (MFN)	The MFN holds several commercial communal licences for groundfish, capelin, herring, mackerel, snow crab, squid, swordfish, scallop, bluefin tuna and other tuna species, and seal. MFN has nine enterprises that permit access to NAFO 3KL, three tuna licences permitting access to 3LN, and one seal licence permitting access to Seal Fishing Areas 4-33 (Atlantic-wide). The First Nation also holds licences for sea cucumber and whelk in NAFO 3Ps. In addition, MFN holds tuna and swordfish licences for the Scotia-Fundy region.
Qalipu Mi'kmaq First Nation Band (QMFNB)	The Qalipu hold several commercial communal licences for lobster, snow crab, mackerel, herring, squid, scallops, capelin, whelk, shrimp, eel, smelt and bait. Lobster fishing licences are for LFA 4B, 13A, and 13B and snow crab licences are for Snow Crab Areas 4, 12, 12C, 12E and 12F. Mi'kmaq Alsumk Mowimsikik Koqoey Association (MAMKA) also holds several commercial communal licences for snow crab, herring, capelin, lobster, and bait. MAMKA also holds a commercial communal scallop licence.
MAMKA (formed by MFN and QMFNB under DFO's Aboriginal and Aquatic Resources Management Program)	One enterprise with a groundfish licence permitting access to NAFO Subdivisions 3KL.
Source: Adapted from Nexen 2018	

3.3.2 Indigenous Communities

Newfoundland and Labrador has five Indigenous communities and/or governing bodies. There are two on the Island of Newfoundland (Miawpukek First Nation [MFN]; Qalipu Mi'kmaq First Nation Band [QMFNB] and three in Labrador (Nunatsiavut Government, Innu Nation, and Nunatukavut Community Council [NCC]). EL 1161 is approximately 530 km to the nearest reserve (Miawpukek) (Figure 3-5):

- The Nunatsiavut Government is comprised of five Inuit Community Governments (representing Nain, Hopedale, Postville, Makkovik and Rigolet) (Nunatsiavut Government 2017)). Some Inuit are resident in other communities in Labrador (Happy Valley-Goose Bay, North West River, and Mud Lake). The Labrador Inuit Land Claims Agreement delineates an established Labrador Inuit Settlement Area (LISA) and sets out the details of land ownership, resource-sharing, and self-government within the LISA (Nalcor Energy 2011). EL 1161 is approximately 1,015 km to the LISA and 980 km to The Zone.
- There are approximately 2,200 Innu of Labrador, formally represented by Innu Nation. Most Labrador Innu live in Natuashish (Mushuau Innu First Nation) and Sheshatshiu (Sheshatshiu Innu First Nation) located in Sheshatshiu), while small numbers also reside in Happy Valley-Goose Bay (Nalcor Energy 2011). The Labrador Innu claim Aboriginal rights and title to much of Labrador. The Tshash Petapen / New Dawn Agreement was signed on November 18, 2011; negotiations are ongoing between Innu Nation and the Governments of Newfoundland and Labrador and Canada (Newfoundland and Labrador Intergovernmental and Indigenous Affairs Secretariat 2017).
- NunatuKavut is the territory of the Inuit of NunatuKavut, who reside primarily in southern (Cartwright to L'Anse au Clair), central (Upper Lake Melville area), and western Labrador (Nalcor Energy 2011). The approximately 6,000 Inuit of south and central Labrador are represented by the NCC (NCC 2013). Their asserted Inuit land claim covers most of Labrador; and, although it has not been accepted for negotiation by the federal or provincial governments, the provincial Labrador and Aboriginal Affairs Office has advocated for a decision from the Federal Government on the NCC land claim (Newfoundland and Labrador Intergovernmental and Indigenous Affairs Secretariat 2017). EL 1161 is approximately 750 km to the NCC primary claim area in Labrador
- The Miawpukek Mi'kamawey Mawi'omi First Nation Reserve is located on the south coast of the island of Newfoundland at the mouth of the Conne River (MFN 2017). MFN has a self-governing agreement (which is not a treaty or lands claims agreement within the meaning of sections 25 and 35 of the *Constitution Act*, 1982) that gives them the opportunity to govern their internal affairs and assume greater responsibility and control over decisions that affect their community (Indigenous and Northern Affairs Canada 2014). EL 1161 is approximately 530 km from the MFN Reserve.
- The QMFNB are one of the largest First Nation groups in Canada, with approximately 24,000 members spread across many communities on the Island of Newfoundland (and abroad). Qalipu was established in 2011 as an Indian Act Band under the *Qalipu Mi'kmaq First Nation Act* (which is not a treaty or lands claims agreement within the meaning of sections 25 and 35 of the *Constitution Act*, 1982). There are no reserve lands; however, the Qalipu are made up of 66 traditional Mi'kmaq communities, spread out over nine Electoral Wards. The Qalipu central administrative office is in Corner Brook with satellite offices located in Glenwood, Grand Falls-Windsor, and St. George's (QMFNB 2016).

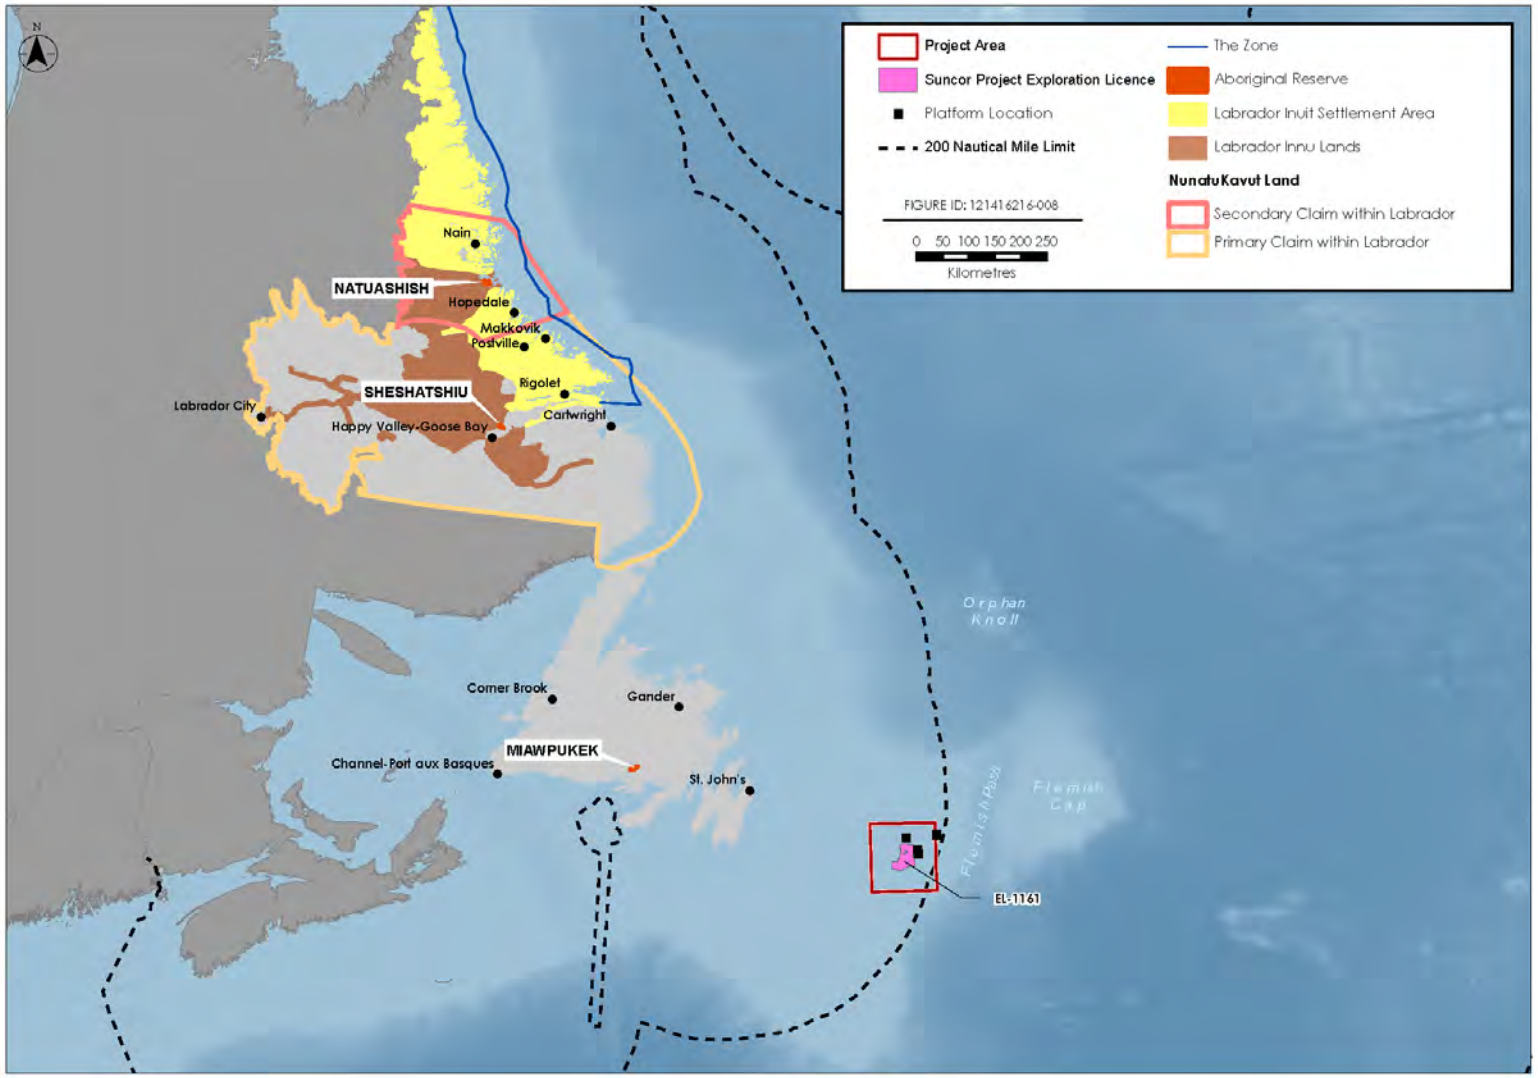

Figure 3-5 Indigenous Communities in Newfoundland and Labrador

For other similar EAs of projects in the eastern Newfoundland offshore region, the CEA Agency has identified Indigenous groups in New Brunswick (NB), Nova Scotia (NS), Prince Edward Island (PEI), and Quebec (QC) (CEA Agency 2017) that have the right to harvest Atlantic salmon and American eel for FSC purposes and/or harvest swordfish (*Xiphias gladius*) under commercial communal fishing licences in NAFO Areas 3, 4 and 5 (Table 3.6; Figure 3-6). While these Indigenous communities hold commercial communal licences for several species, the swordfish licence is the only licence which overlaps with the Project Area.

3.3.3 Other Socio-economic Components and Activities

Other human activities also take place in parts of the Project Area and surrounding marine environment on either a year-round or seasonal basis, including oil and gas exploration and production, shipping, marine research, and defence activities.

Offshore oil and gas production has been occurring off the coast of Newfoundland and Labrador for more than 20 years, and exploration in the region has occurred for a much longer period. Various international oil and gas operators have held, and currently hold, interests in the Newfoundland and Labrador offshore area. In 2013, the C-NLOPB moved into a scheduled land tenure system which divides offshore Newfoundland and Labrador into eight regions. There are currently 30 ELs, 58 SDLs, and 12 Production Licences (PLs) in offshore Newfoundland and Labrador (C-NLOPB 2018) (Figure 3-7). Three of the currently operating production projects (Hibernia, Hebron and Terra Nova) are located within the Project Area.

International shipping lanes transit through the eastern Newfoundland offshore area, and there is potential for vessel traffic in the Project Area and in surrounding areas (Figure 3-8). The eastern region of Newfoundland has more than 15 ports used for both domestic and international shipping (Amec 2014).

Marine research and scientific studies regularly occur in the vicinity of the Project. DFO activities include annual multi-species trawl surveys to monitor fish populations, collection of data from buoys and moorings for DFO's Rapid Climate Change program study, and the Atlantic Zone Off-Shelf Monitoring Program.

Naval training exercises also occur in the general area, which involve both surface vessels and submarines. There are also known and potential unexploded ordnance (UXO) sites in the Atlantic Ocean, which include shipwrecks and submarines (Figure 3-9), as well as munitions disposal sites off eastern Newfoundland (Amec 2014). Marine cable networks (active and decommissioned) also intersect the region (Figure 3-10).

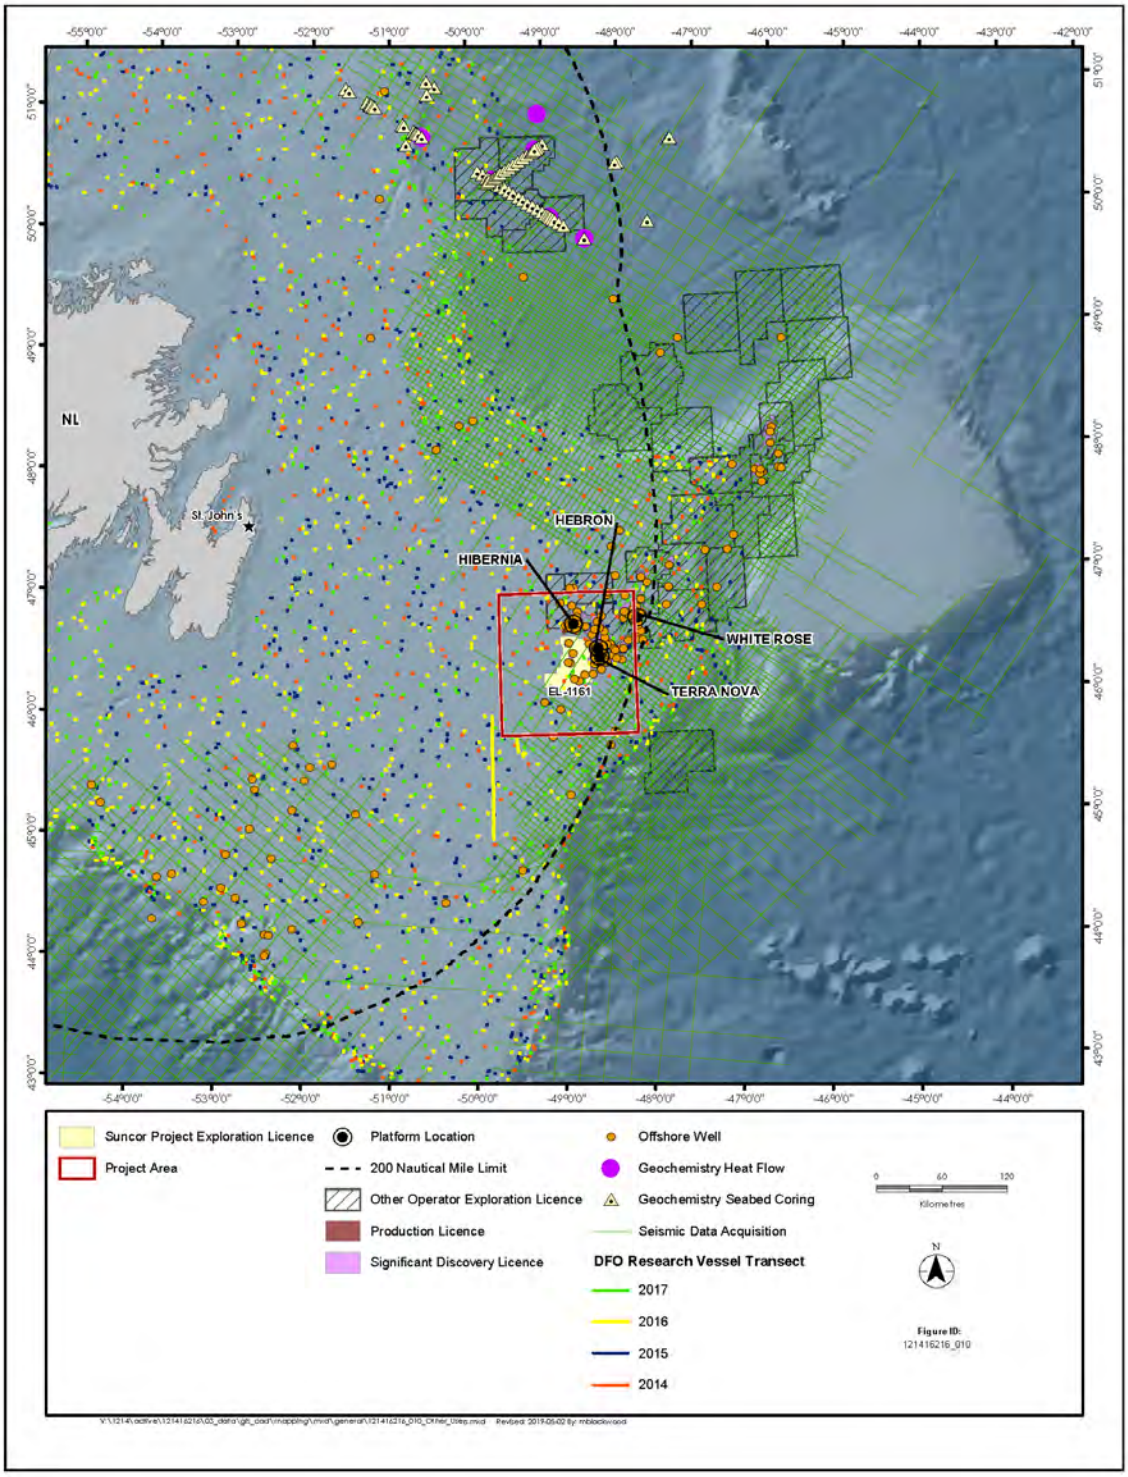

Figure 3-7 Other Socio-economic Components and Activities in Eastern Newfoundland Offshore Area

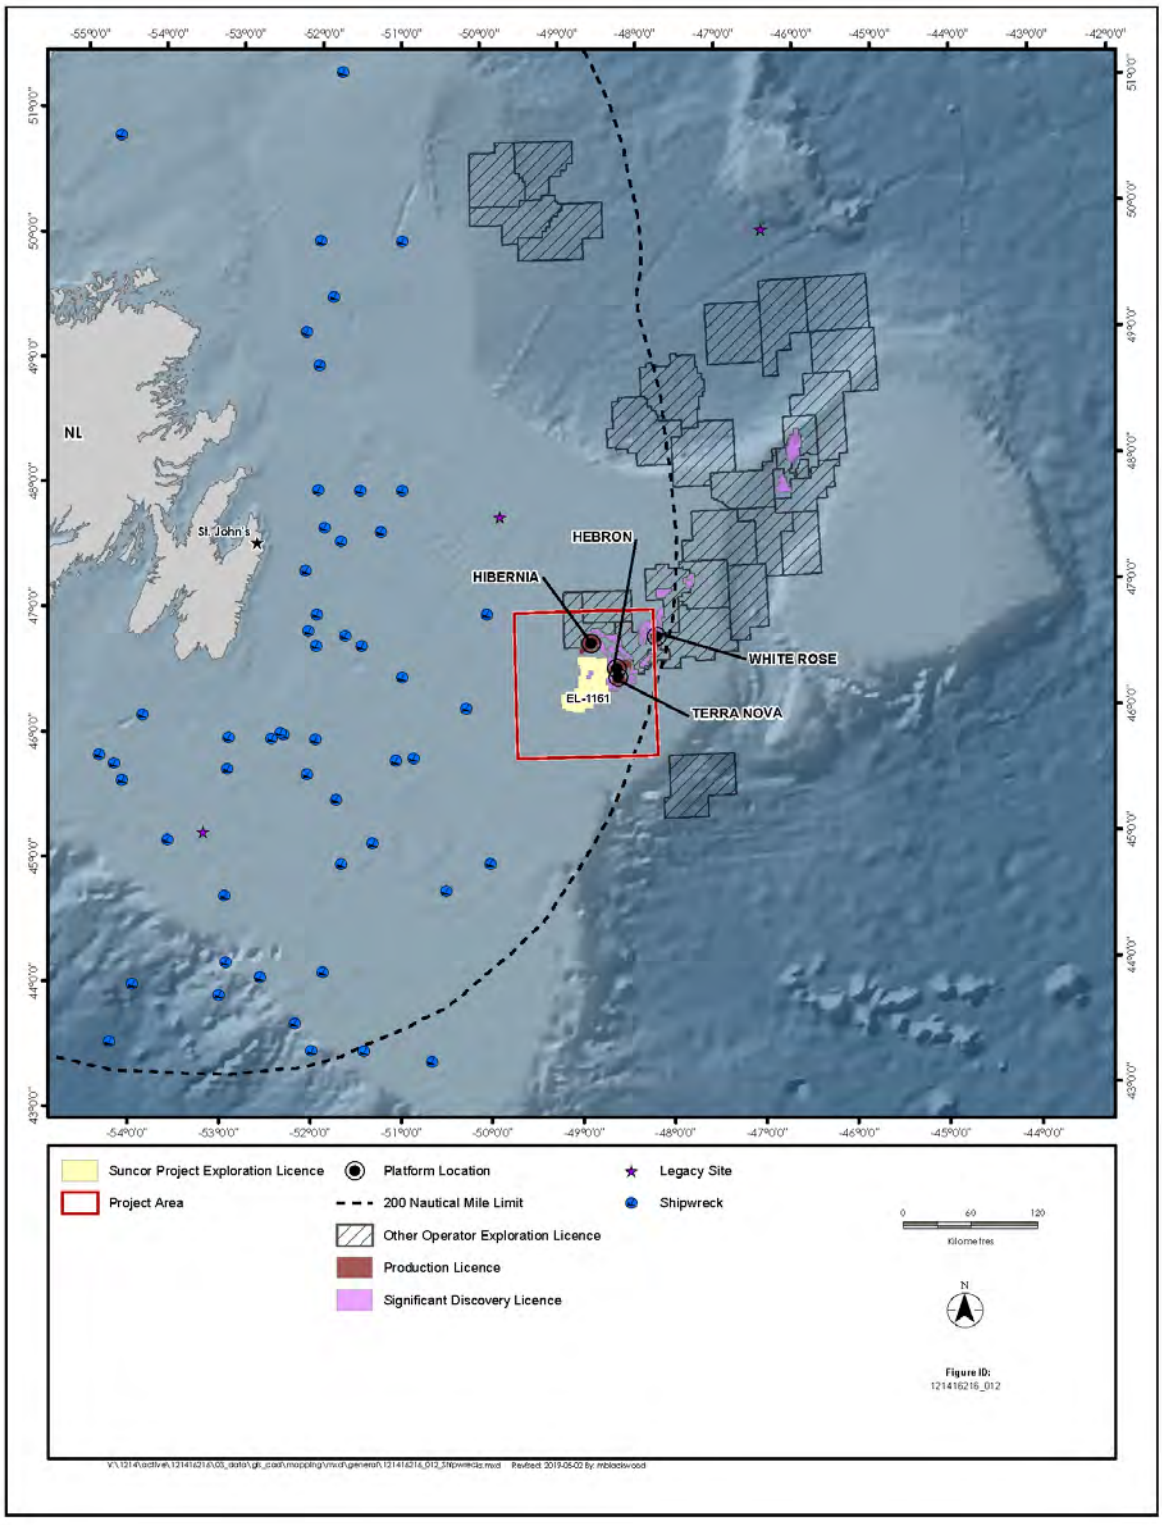

Figure 3-9 Shipwrecks and Legacy Sites in Offshore Newfoundland and Labrador

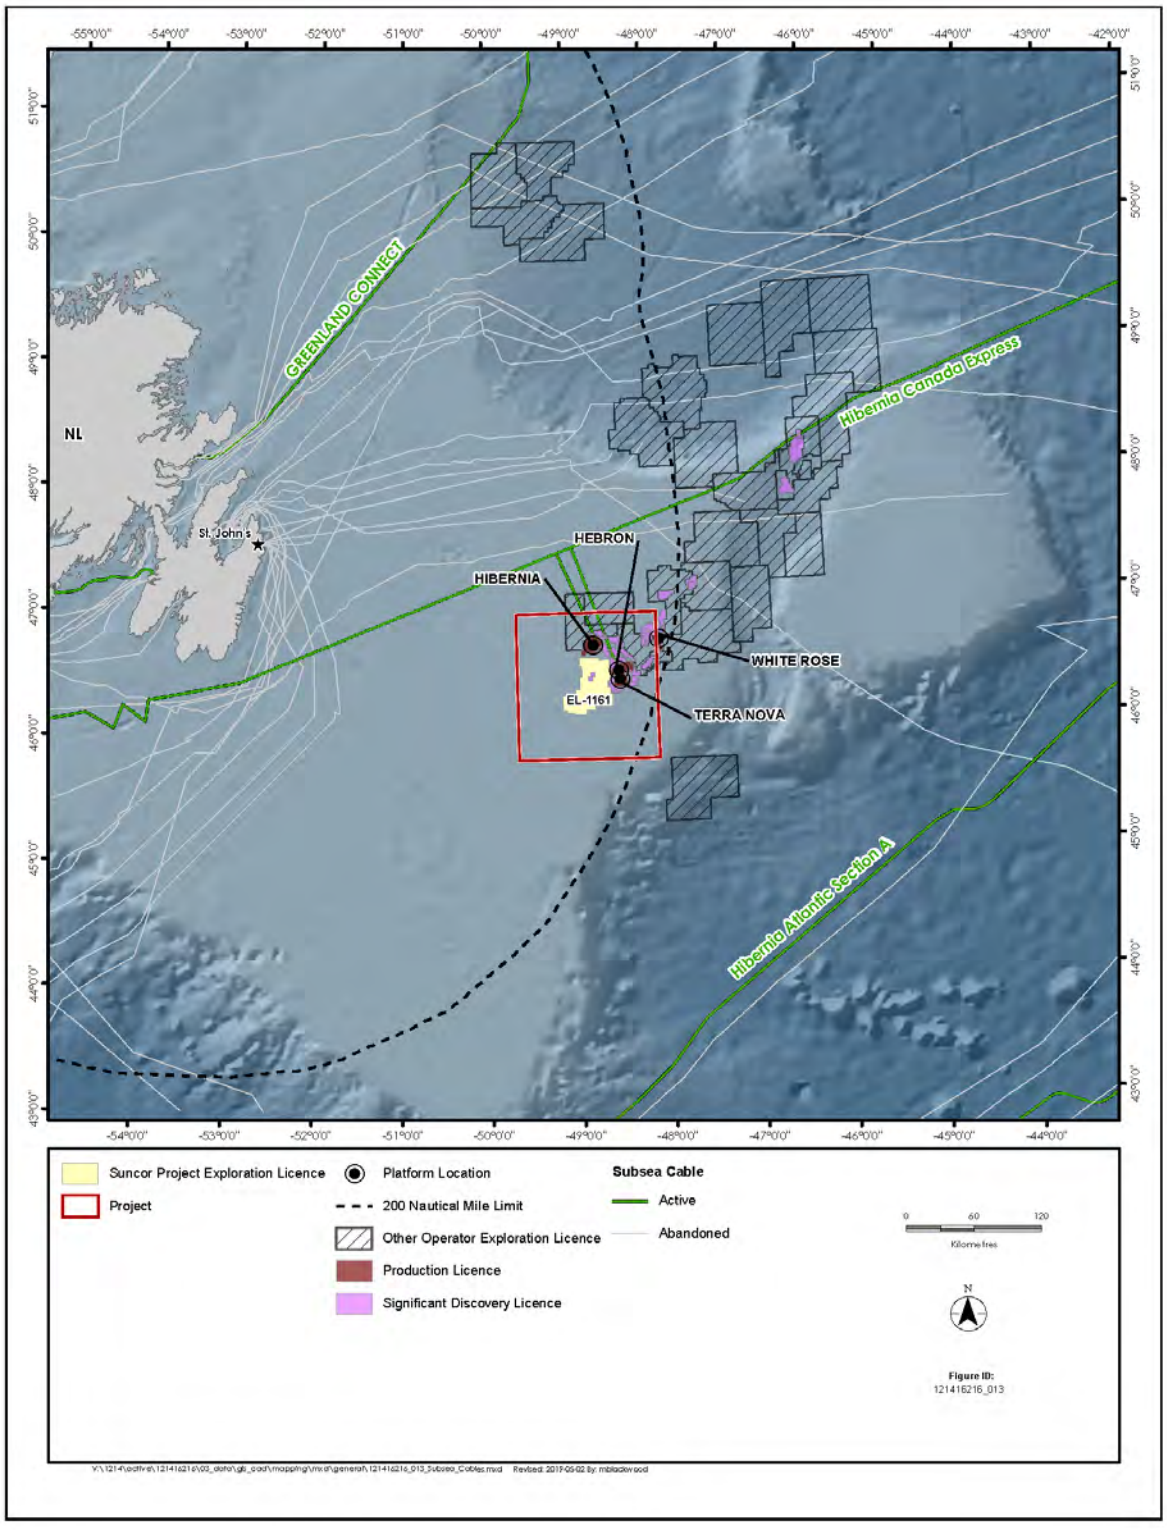

Figure 3-10 Subsea Cables in Offshore Newfoundland and Labrador

3.4 Existing Environmental Studies

Environmental assessments have been completed for offshore oil and gas activities in the vicinity of the Project including exploration drilling, production drilling, and seismic survey projects for nearly three decades in the Canada-Newfoundland and Labrador Offshore Area. These assessments are important sources of information on the region's existing environmental setting, as well as the potential environmental issues and interactions that may be associated with Project activities. The primary studies that are cited in this Project Description to describe the existing environmental setting in the Project Area and surrounding areas, include project-specific EAs conducted for other projects with similar spatial boundaries. Of particular relevance is the SEA for the eastern Newfoundland offshore region (AMEC 2014), which involved identifying, reviewing and presenting regional environmental baseline information (physical, biological, and socio-economic), and completing a review and analysis of likely environmental issues and mitigation and planning approaches as input to future exploration licencing decisions by the C-NLOPB in this area.

It is Suncor's understanding that the Project will not take place on lands that have been subject to a regional study as described in Sections 73 to 77 of CEAA 2012. The Project is located within a proposed study area for a Regional Assessment of offshore oil and gas exploratory drilling east of Newfoundland and Labrador, in the Canada-Newfoundland and Labrador Offshore Area. This is the first Regional Assessment under CEAA 2012. An Agreement to conduct the Regional Assessment has been prepared by the CEA Agency, the C-NLOPB, NRCAN, and the Newfoundland and Labrador Department of Natural Resources.

It is anticipated that the reports listed below, and other relevant studies, will provide sufficient data to characterize the existing environment in the Project Area, and to assess the potential environmental effects associated with the Project.

Key relevant and publicly available environmental studies for consideration include:

- CNOOC International Flemish Pass Exploration Drilling Project (2018-2028) (Nexen 2018)
- Husky Energy Exploration Drilling Project 2018-2025 (Husky Energy 2018)
- BP Canada Energy Group ULC Newfoundland Orphan Basin Exploration Drilling Program, 2017-2026 (BP Canada Energy Group ULC 2018)
- Equinor Canada Ltd. (Statoil Canada Ltd.) Flemish Pass Exploration Drilling Project 2018-2028 (Equinor Canada 2017)
- ExxonMobil Canada Limited Eastern Newfoundland Offshore Exploration Drilling Project 2018-2030 (ExxonMobil Canada Limited 2017)
- Eastern Newfoundland SEA (AMEC 2014)
- Environmental Assessment East Canada CSEM Survey, 2014-2018 (LGL Limited 2014)
- Suncor Energy's Eastern Newfoundland Offshore Area 2D / 3D / 4D Seismic Program, 2014-2024 (Suncor Energy 2013)
- White Rose Extension Project Environmental Assessment (Husky Energy 2012)
- Hebron Project Comprehensive Study Report (ExxonMobil Canada Properties 2011)
- Environmental Assessment of Chevron's North Grand Banks Regional Seismic Program, 2011-2017 (LGL 2011a)
- Environmental Assessment of Statoil's Geophysical Program for Jeanne d'Arc Basin and Central Ridge / Flemish Pass Basins, 2011-2019. (LGL 2011b).
- Environmental Assessment of Husky's Jeanne d'Arc Basin / Flemish Pass Regional Seismic Program, 2012-2020 (LGL 2011c)

- Environmental Assessment of StatoilHydro Canada Ltd. Exploration and Appraisal/Delineation Drilling Program for Offshore Newfoundland, 2008-2016 (LGL 2008)
- Husky Delineation/Exploration Program for Jeanne d'Arc Basin Area, 2008-2017, Environmental Assessment (LGL 2007)
- Husky White Rose Development Project: New Drill Centre Construction and Operations Program Environmental Assessment (LGL 2006)
- Orphan Basin SEA (LGL 2003)
- Orphan Basin Exploration Drilling Program Environmental Assessment (LGL 2005)
- White Rose Oilfield Comprehensive Study (Husky Oil Operations Limited 2000)

4.0 CONSULTATION AND ENGAGEMENT

Suncor's Stakeholder Relations Policy outlines the overall approach and commitment to consultation and engagement. Suncor aspires to be a sustainable energy company and as such, recognizes that the trust and support of stakeholders is an important component of this vision. In particular, Suncor strives to be a trusted member of the communities in which they operate. Stakeholders are identified as the individuals and/or groups who could be affected by Suncor operations or who could, through their actions, affect Suncor's business.

Suncor is committed to developing and maintaining positive, meaningful relationships with stakeholders and as part of this, to understanding their interests, issues, needs and concerns. It also understands that relationships are based on transparency, mutual respect and trust. For this Project, Suncor recognizes the importance of early and ongoing Indigenous and stakeholder engagement that continues over the life of the Project and the significant mutual benefits that stem from successful stakeholder relations, including:

- Enabling informed decision making
- Resolving issues with timely, cost-effective and mutually beneficial solutions
- Building stronger communities
- Supporting shared learning

4.1 Indigenous Engagement

Based on the results of other EAs conducted for exploration drilling projects offshore NL, the list of Indigenous organizations that may have a potential interest in the Project includes groups and communities in Newfoundland and Labrador, Quebec, New Brunswick, Prince Edward Island, and Nova Scotia, as follows:

Newfoundland and Labrador

- Nunatsiavut Government
- Innu Nation
- NCC
- QMFNB
- MFN

Quebec

- Mi'gmawei Mawiomi Secretariat (MMS), which represents the following Mi'gmaq First Nation groups:
  - Micmas of Gesgapegiag
  - La Nation Micmac de Gespeg
  - Listuguj Mi'gmaq Government
- Les Innus de Ekuanitshit
- Montagnais de Nutashkuan

New Brunswick

- Mi'gmawe**'l** Tplu'taqnn Inc. (MTI), which represents the following Mi'kmaq First Nation groups:
  - Fort Folly First Nation
  - Eel Ground First Nation
  - Pabineau First Nation
  - Esgenoôpetitj First Nation
  - Buctouche First Nation
  - Indian Island First Nation
  - Eel River Bar First Nation
  - Metepnagiag Mi'kmaq First Nation
- Elsipogtog First Nation
- Wolastoqey Nation of New Brunswick (WNNB), which coordinates consultation with the following five Maliseet First Nations (letters were sent to individual communities; follow up occurred with the WNNB):
  - Kingsclear First Nation
  - Madawaska Maliseet First Nation
  - Oromocto First Nation
  - St. Mary's First Nation
  - Tobique First Nation
- Woodstock First Nation
- Peskotomuhkati Nation at Skutik (Passamaquoddy)

Prince Edward Island

- Mi'kmaq Confederacy of PEI (MCPEI), which represents the following Mi'kmaq First Nations in consultation (letters were sent to individual communities; follow-up occurred with MCPEI):
  - Abegweit First Nation
  - Lennox Island First Nation

Nova Scotia

- Kwilmu'kw Maw-klusuaqn Negotation Office (KMKNO), which represents the following 11 Mi'kmaq First Nations in Nova Scotia in consultation and engagement (letters were sent to individual communities; follow-up occurred with the KMKNO):
  - Acadia First Nation
  - Annapolis Valley First Nation
  - Bear River First Nation
  - Eskasoni First Nation
  - Glooscap First Nation
  - Membertou First Nation
  - Paqtnkek Mi'kmaw Nation
  - Pictou Landing First Nation
  - Potlotek First Nation
  - Wagmatcook First Nation
  - We'koqmaq First Nation
- Sipekne'katik First Nation
- Millbrook First Nation

The identified Indigenous groups in Newfoundland and Labrador are known to hold commercial communal fishing licences within NAFO Area 3L, which overlaps the Project Area. These licences are issued under Aboriginal Communal Fishing Licences Regulations (SOR/93-332) of the *Fisheries Act*. Although the licences are issued, the Indigenous groups may not execute all fisheries, and there are no identified FSC fisheries within the Project Area (Husky Energy 2018). NCC, Innu Nation, and the Nunatsiavut Government hold FSC fishing licences for species that may migrate between the Project Area and the Labrador coast.

The potential interest in the Project is similar for Indigenous groups in Quebec and the rest of Atlantic Canada. Some communities hold commercial communal licences in NAFO Division 3L that overlaps the Project Area, and/or participate in FSC fisheries for species that may migrate through the Project Area. There is also the potential for species at risk and/or of cultural importance to be present in the Project Area (e.g., Atlantic salmon and American eel).

In recognition of this potential interest in the Project, Suncor emailed letters on May 9, 2019, to each of the groups listed above to introduce the Project and to inquire about potential interests and concerns, as well as preferred method of engagement going forward. As of submission of this Project Description, no responses had been received from the initial letters. However, based on the assessments of similar projects in the region, we understand important Indigenous concerns to be addressed in the Suncor EIS include potential effects of Project operations on Atlantic salmon and other migratory species that maybe harvested for FSC or commercial communal fisheries and the potential effects of accidental events on the marine ecosystem.

Ongoing engagement will include confirmation of appropriate organization and/or community contacts and methods for future engagement, learning more about how these groups may potentially be affected by Project activities, providing Project planning updates, listening and responding to questions and concerns raised by Indigenous groups in a timely manner, and meeting with Indigenous groups if and when requested. Feedback obtained during engagement will be incorporated into Project planning as applicable and appropriate. The EIS (if required under CEAA 2012) will document concerns and priorities raised and demonstrate how these have influenced Project planning and/or been addressed in the EIS.

4.2 Stakeholder Engagement

Suncor, as operator of the Terra Nova project, maintains regular communication and engagement with stakeholders having an interest in the NL offshore. The stakeholders with potential interest in this Project would be similar and would likely include fisheries organizations, environmental non-governmental organizations (NGOs), industry associations, government, and the interested public. Each of these groups is discussed below.

4.2.1 Government and Regulatory Stakeholders

Regulatory stakeholders are typically engaged to confirm specific regulatory requirements/processes and/or data requests and to ascertain the mandates / interests of each department or agency with respect to this Project. Key regulatory stakeholders for the Project are listed below:

- C-NLOPB
- Government of Canada
  - CEA Agency
  - DFO
  - ECCC
  - Canadian Coast Guard
  - NRCAN
  - Department of National Defence (DND)
  - Transport Canada
  - Health Canada
  - Parks Canada
  - Indigenous Services Canada
- Government of Newfoundland and Labrador
  - Municipal Affairs and Environment
  - Fisheries and Land Resources
  - Natural Resources

To date, Suncor has been in consultation with the CEA Agency to introduce the Project and seek feedback on the regulatory processes required for Project approval. The C-NLOPB is also aware of the proposed Project. Suncor will consult with the above listed organizations, departments and agencies during the EA process and subsequent regulatory approvals for the Project.

4.2.2 Fisheries Stakeholders

A key form of mitigation for potential effects of the Project on fisheries is early and ongoing consultation with the fishing industry. Suncor meets regularly with fisheries groups to keep them apprised of activities in the Terra Nova Field. The location and timing of fishing activities are important to consider when identifying potential fisheries stakeholders and scheduling meetings. Suncor has therefore consulted with One Ocean on the approach for fishing industry consultation. Subsequently, an email to introduce the Project and to solicit concerns has been sent to the following organisations:

- One Ocean
- Fish, Food and Allied Workers-Unifor (FFAW-Unifor)
- Association of Seafood Producers (ASP)
- Ocean Choice International (OCI)
- Atlantic Groundfish Council (AGC)
- Canadian Association of Prawn Producers (CAPP)

4.2.3 Other Public Stakeholder Groups

Other public stakeholders include industry associations and NGOs. Suncor will monitor activities and communications generated by these groups and participate in local industry events as appropriate, including supplier information sessions, seminars, and conferences. Project information will also be provided on Suncor's external website.

4.3 Summary of Indigenous and Stakeholder Engagement to Date

Table 4.1 summarizes Suncor's engagement efforts to date. Continuous engagement is planned throughout the process.

Table 4.1 Summary of Engagement to Date

Organization	Date	Type of Engagement	Purpose	Comments / Concerns
Federal and Provincial Government Organizations, Agencies, and Departments				
CEA Agency	04/04/19	meeting	Introduction of Tilt Cove Project	No comments/concerns to date. Will follow up.
C-NLOPB	01/22/19	meeting	Introduction of Tilt Cove Project	No comments/concerns to date. Will follow up.

Spoke with Mr. Gerardin regarding his email of 05/13/19 and attachment entitled Mémoire Nutashkuan_EIE _Statoil – Exxon _12_II-2018. Mr. Gerardin requested an ecosystem approach to the assessment.

5.0 POTENTIAL PROJECT-RELATED CHANGES TO THE ENVIRONMENT AND SCOPING CONSIDERATIONS

Under CEAA 2012, a Project Description is required to describe potential changes to fish and fish habitat, aquatic species, and migratory birds that may be affected as a result of carrying out the Project. The Project Description must also provide information on the effects of potential environmental changes to federal or transboundary lands, and on Indigenous peoples. Therefore, the following sections provide an overview of potential environmental issues and interactions that may result from both routine and non-routine Project activities, and a discussion of some relevant items and considerations related to the scope of an EIS that may eventually be required for it.

5.1 Routine Project Activities

Routine Project activities associated with offshore exploration drilling and their potential interactions with and effects on the environment are well defined and understood. The main activities with the potential to result in changes to the environment include:

- Presence and operation of the MODU (lights, flaring, underwater sound, and safety zone)
- Well abandonment (noise and lights during abandonment activities)
- Presence and operation of supply vessels (lights, underwater sound) and helicopters (noise)
- Discharges and emissions (e.g., drill muds and cuttings, liquid discharges, atmospheric emissions, solid waste)

Table 5.1 lists the potential environmental interactions with routine Project activities that may result in changes to the environmental components identified in CEAA 2012. These potential interactions would be assessed in more detail in the EIS if a federal EA process is required under CEAA 2012.

Table 5.1 Potential Environmental Interactions with Routine Project Activities

Environmental Component of Concern	Relevant Section of CEAA 2012	Potential Environmental Interactions
Fish, Fish Habitat, and Aquatic Species	5(1)(a)(i) 5(1)(a)(ii)	Routine Project activities have the potential to result in changes affecting fish, fish habitat, aquatic species as defined under SARA, marine mammals, and other aquatic species (including aquatic plants), due to the following interactions: • Aquatic species response to underwater sound emissions associated with supply vessel transit and drilling • Localized degradation and disturbance to the benthic environment (including benthic species) due to seabed disposal at drill site(s) (i.e., drill mud/cuttings, cement) including potential smothering and mortality of benthic organisms • Localized effects on marine water quality due to routine ocean discharges (e.g., waste water) from MODU and supply vessels • Potential injury or mortality to marine mammal(s) from supply vessel collisions

Table 5.1 Potential Environmental Interactions with Routine Project Activities

Environmental Component of Concern	Relevant Section of CEAA 2012	Potential Environmental Interactions
Migratory Birds	5(1)(a)(iii)	Routine Project activities have the potential to result in changes affecting migratory birds, as defined under the *Migratory Birds Convention Act*, 1994, due to the following interactions: • Attraction of migratory birds to supply vessel and MODU lighting (including flares) and discharges (e.g., food wastes) • Mortality or stranding of migratory birds on the MODU or supply vessels
Project Activities Occurring on Federal Lands	5(1)(b)(i)	Routine Project activities may result in changes to the environment that would occur on federal waters as a result of the Project Area being located within Canada's EEZ and thus within federal waters under the jurisdiction of the Government of Canada. These potential effects occurring in federal waters are described within this table. In addition to components of the environment previously addressed above (e.g., effects on water quality, fish, fish habitat, aquatic species and migratory birds) there could also be effects on the atmospheric environment (e.g., air emissions, including GHG emissions and sound emissions).
Transboundary Issues	5(1)(b)(ii)	In addition to components of the environment previously addressed above (e.g., effects on water quality, fish, fish habitat, aquatic species and migratory birds) there could also be effects on the atmospheric environment (e.g., air, GHG, and noise emissions).
Health and Socio-Economic Conditions for Indigenous People	5(1)(c)(i)	Routine Project activities have the potential to result in the following changes to the environment that may affect Indigenous fishing activities, including those carried out under commercial communal licences in and around the Project Area, and associated potential effects to socio-economic conditions: • Establishment of a safety zone (fisheries exclusion zone) around the drilling vessel during drilling activities, as required by the C-NLOPB, and associated spatial and temporal restrictions on Indigenous fish harvesting activity • Fish species response to underwater sound emissions, including changes in behaviour and distribution of targeted species • The Project is also expected to have economic benefits, including economic and contracting opportunities. • Routine supply vessel operations outside of the safety zone will be consistent with existing offshore and nearshore shipping traffic in the region and are not anticipated to result in changes to the environment that would affect Indigenous fishing activities. • Routine Project activities are not expected to result in changes to the environment that would affect the health conditions of Indigenous peoples.

Table 5.1 Potential Environmental Interactions with Routine Project Activities

Environmental Component of Concern	Relevant Section of CEAA 2012	Potential Environmental Interactions
Health and Socio-Economic Conditions	5(2)(b)(i)	Routine Project activities have the potential to result in the following changes to the environment that may affect commercial fishing activities, including those carried out under commercial licences in and around the Project Area: • Establishment of a safety zone (fisheries exclusion zone) around the drilling vessel during drilling activities, as required by the C-NLOPB, and associated spatial and temporal restrictions on commercial fish harvesting activity • Fish species response to underwater sound emissions, and associated changes in behavior and distribution of commercial fish species • The Project is also expected to have economic benefits, including economic and contracting opportunities. • Routine supply vessel operations outside of the safety zone will be consistent with existing offshore and nearshore shipping traffic in the region and are not anticipated to result in changes to the environment that would affect commercial fishing activities. • Routine Project activities are not expected to result in changes to the environment that would affect health conditions.
Physical and Cultural Heritage or Resources of historical, Archaeological, Paleontological, or Architectural Significance	5(1)(c)(ii) 5(1)(c)(iv) 5(2)(b)(ii) 5(2)(b)(iii)	Routine Project activities are not anticipated to result in changes to the environment that would affect physical and cultural heritage areas or resources including shipwrecks that have been recorded in the Project Area. Information gathered during 3D seismic surveys previously conducted by others and pre-drill ROV site surveys in the Project Area will document the presence/absence of marine heritage resources on the seabed before seabed disturbance takes place. If concerns related to this matter are identified during Indigenous engagement for this Project, they will be considered in the EIS.
Current Use of Lands and Resources for Traditional Purposes by Indigenous People	5(1)(c)(iii)	Routine Project activities are not anticipated to result in changes to the environment that would have an effect on the current use of land and resources for traditional purposes by Indigenous peoples, other than commercial communal fisheries and associated socio-economic interactions (discussed above), given the Project Area's water depth and distance from shore. Routine supply vessel activities will be consistent with existing shipping traffic in the region and are not anticipated to result in changes to the environment that would have an effect on traditional Indigenous fisheries and resource use. Additional information regarding traditional Indigenous fisheries and traditional resource use will be gathered through Indigenous engagement, and concerns related to this matter identified during engagement will be considered in the EIS.
Other Changes to the Environment Directly Related or Necessarily Incidental to a Federal Authority's Exercise of a Power or Performance of Duty or Function in Support of the Project	5(2)(a) 5(1)(b)(i)	Routine Project activities authorized by the C-NLOPB have the potential to result in directly related or necessarily incidental changes to the atmospheric environment due to the release of air emissions

5.2 Non-Routine Project Activities

A non-routine Project activity, such as an accidental events or malfunctions, would also result in potential changes to the environment. For the purposes of environmental assessment, worst-case scenarios are considered, and for an offshore exploration drilling project, this would include a blowout (i.e., an uncontrolled release of hydrocarbons during drilling) or a batch spill or release from the MODU or supply vessel (e.g., hydraulic fluid, drilling mud, diesel). These events could occur in the offshore environment (e.g., during drilling) or nearshore environment (e.g., during supply vessel transit). As part of the environmental assessment process, detailed spill trajectory modelling will be conducted to predict the areas that could potentially be affected by a spill. Potential environmental interactions can occur within the spill trajectory or as a result of transitory species or their prey travelling through an affected area.

If an EIS is required under CEAA 2012, it will describe and assess non-routine Project activities, including the results of associated spill modelling which will form an integrated part of the associated environmental effects analysis and the identification of appropriate mitigation. The EIS will also describe relevant accident prevention and emergency response plans and procedures. Table 5.2 provides further detail on how non-routine Project activities could result in changes to the environment.

Table 5.2 Potential Environmental Interactions with Non-routine Project Activities

Environmental Component of Concern	Relevant Section of CEAA 2012	Potential Environmental Interactions
Fish, Fish Habitat, and Aquatic Species	5(1)(a)(i) 5(1)(a)(ii)	A spill during Project activities could potentially result in changes to fish, fish habitat, aquatic species as defined in SARA, marine mammals, and other aquatic species, including: • Reduced availability and quality of habitat • Degradation and reduction in marine water quality • Injury, mortality and/or reduced health for fish and other aquatic species
Migratory Birds	5(1)(a)(iii)	A spill during Project activities could potentially result in changes to migratory birds, as defined under the *Migratory Birds Convention Act*, 1994, including injury, mortality and/or reduced health for migratory bird species.
Project Activities Occurring on Federal Lands	5(1)(b)(i)	A spill during Project activities could potentially result in changes to the environment that would occur in federal waters as a result of the Project Area being located within Canada's EEZ and thus within federal waters under the jurisdiction of the Government of Canada. These potential effects occurring in federal waters are described within this table. Components of the environment not previously addressed above include potential effects on the atmospheric environment (e.g., air and noise emissions).
Transboundary Issues	5(1)(b)(ii)	A spill may result in transboundary effects outside of Newfoundland and Labrador or Canadian offshore areas. A spill may enter international waters, which fall outside the Canadian EEZ. Spill-related effects in international waters could include adverse effects to birds, fish, fish habitat, and commercial fisheries.

Table 5.2 Potential Environmental Interactions with Non-routine Project Activities

Environmental Component of Concern	Relevant Section of CEAA 2012	Potential Environmental Interactions
Health and Socio-Economic Conditions for Indigenous People	5(1)(c)(i)	A spill during Project activities could potentially result in the following changes to the environment that may affect Indigenous fisheries and associated socio-economic conditions: • Contamination-related closure of commercial fishing areas, and associated restrictions on commercial communal fish harvesting activity • Reduced catchability associated with damage to fishing gear (e.g., fouling) and changes in population health, behavior, and distribution of commercial fish species as a result of marine pollution • Changes in population size and health of individuals among commercial fish species, and associated loss of income through reduced catch value • A vessel collision with fishing gear could potentially result in changes to the environment that may affect human health and safety for Indigenous peoples.
Health and Socio-Economic Conditions	5(2)(b)(i)	A spill during Project activities could potentially result in the following changes to the environment that affect fisheries: • Contamination-related closure of commercial fishing areas, and associated restrictions on commercial fish harvesting activity • Reduced catchability associated with damage to fishing gear (e.g., fouling) and changes in population health, behavior, and distribution of commercial fish species as a result of marine pollution • Changes in population size and health of individuals among commercial fish species, and associated loss of income through reduced catch value • A vessel collision with fishing gear could potentially result in changes to the environment that may affect human health and safety.
Physical and Cultural Heritage or Resources of historical, Archaeological, Paleontological, or Architectural Significance	5(1)(c)(ii) 5(1)(c)(iv) 5(2)(b)(ii) 5(2)(b)(iii)	A spill during Project activities could potentially cause a change to the environment that may affect physical and cultural heritage area (including shipwrecks). However, given the location of the Project offshore, and the ROV survey prior to drilling, non-routine Project activities are not expected to result in changes to resources of historical, archeological, paleontological, or architectural significance.

Table 5.2 Potential Environmental Interactions with Non-routine Project Activities

Environmental Component of Concern	Relevant Section of CEAA 2012	Potential Environmental Interactions
Current Use of Lands and Resources for Traditional Purposes by Indigenous People	5(1)(c)(iii)	A spill during Project activities could potentially result in the following changes to the environment that may affect traditional Indigenous fisheries, including the Aboriginal and/or Treaty rights to fish, in the area: • Contamination-related closure of traditional fishing areas, and associated restrictions on traditional fish harvesting activity • Reduced catchability associated with damage to fishing gear (e.g., fouling) and changes in population size, behaviour, and distribution of targeted fish species as a result of marine pollution • Changes in population size and health of individuals among targeted fish species, and associated reduction in fishery for traditional use • These changes could potentially occur within the spill trajectory or as a result of migratory fish species transiting through the affected area.
Other Changes to the Environment Directly Related or Necessarily Incidental to a Federal Authority's Exercise of a Power or Performance of Duty or Function in Support of the Project	5(2)(a) 5(1)(b)(i)	A spill occurring as a result of Project activities authorized by the C-NLOPB could potentially result in temporary and localized changes to marine and atmospheric environment. These potential changes have been discussed above.

5.3 Scoping Considerations

If required, the EIS for this Project will be planned and prepared in accordance with the requirements of CEAA 2012 and its associated Regulations, and in compliance with the EIS Guidelines that may be issued by the Agency. Overall, the EIS will provide the required information about the Project, its existing environmental setting, potential environmental effects, proposed mitigations, and associated residual environmental effects and proposed follow-up initiatives.

It is generally accepted that environmental effects are assessed by considering the individual biophysical and socio-economic components that could be affected by the Project and the resultant Project-related effects. Based on the interactions discussed in Tables 5.1 and 5.2 and recent EAs for similar exploration projects, the proposed valued components (VCs) to be assessed in an EIS (if required) will likely include:

- Marine Fish and Fish Habitat (including species at risk and species of conservation concern)
- Marine and Migratory Birds (including species at risk and species of conservation concern)
- Marine Mammals and Sea Turtles (including species at risk and species of conservation concern)
- Special Areas
- Commercial Fisheries and Other Ocean Users
- Indigenous Communities

Final direction on VCs to be assessed would be provided in the EIS Guidelines and would be made in consideration of the components and activities described in Chapter 2 as part of the Project. In particular, existing facilities in eastern Newfoundland will be used for supply, support, and logistical functions, and third-party service providers will be responsible for obtaining and/or maintaining applicable regulatory approvals to operate their facilities. The Project will not require the development of new infrastructure or upgrades to these existing facilities to support Project operations. Logistical support from supply vessels and helicopters is also well established for the offshore Newfoundland oil and gas industry but is proposed to be assessed as it travels from the onshore supply base to the MODU. It is therefore proposed that the scope of the EIS be limited to offshore components should a federal EA process be required under CEAA 2012.

APPENDIX A

Table of Concordance

Regulation Clause	Guideline Section	Regulation SOR 2012-148 Requirement	Guidance to Support Regulation Requirement	Project Description Section(s)
General Information				
1	1.2.1	The name of the project	Name of the designated project.	1.0
1	1.1	The nature of the project	Describe the nature of the designated Project, and proposed location (2–3 paragraphs; note that additional location details are to be provided in section 3).	1.1
1	1.1	The proposed location of the project	Proposed location of the project.	1.1, 2.1
2	1.2	The proponent's name and contact information and the name and contact information of their primary representative for the purpose of the description of the project.	Provide proponent contact information: (a) Name of the designated Project. (b) Name of the proponent. (c) Address of the proponent. (d) Chief Executive Officer or equivalent (include name, official title, email address and telephone number). (f) Principal contact person for purposes of the Project description (include name, official title, email address and telephone number).	1.0, 1.1, 1.2
3	1.3	A description of and the results of any consultations undertaken with any jurisdictions and other parties including Aboriginal peoples and the public.	Provide a list of any jurisdictions and other parties including Aboriginal groups and the public that were consulted during the preparation of the Project description. (A description of the result of any consultations undertaken is to be provided in sections 6 and 7).	4
4	1.4	The environmental assessment and regulatory requirements of other jurisdictions.	Provide information on whether the designated Project is subject to the environmental assessment and/or regulatory requirements of another jurisdiction(s).	1.3
4.1	1.5	A description of any environmental study that is being or has been conducted of the region where the project is to be carried out.	Provide information on whether the designated Project will be taking place in a region that has been the subject of a regional environmental study. Proponents are advised to contact the Agency during the preparation of the project description for information regarding any regional environmental studies that may be relevant.	2.1, 3.4

Regulation Clause	Guideline Section	Regulation SOR 2012-148 Requirement	Guidance to Support Regulation Requirement	Project Description Section(s)
Project Information				
5	2.1	A description of the Project's context and objectives.	Provide a general description of the project, including the context and objectives of the project. Indicate whether the designated project is a component of a larger project that is not listed in the *Regulations Designating Physical Activities.*	1.1, 1.3
6	2.2	The provisions in the schedule to the *Regulations Designating Physical Activities* describing the project in whole or in part.	Indicate the provisions in the schedule to the *Regulations Designating Physical Activities* that describe the designated physical activities that are proposed to be carried out as part of the designated project.	1.3.2, 2.2
7	2.3.1	A description of the physical works that are related to the project including their purpose, size and capacity.	Provide a description of the components associated with the proposed project, including: Physical works associated with the designated project (e.g., large buildings, other structures, such as bridges, culverts, dams, marine transport facilities, mines, pipelines, power plants, railways, roads, and transmission lines) including their purpose, approximate dimensions, and capacity. Include existing structures or related activities that will form part of or are required to accommodate or support the designated project.	2.2
8	2.3.2	The anticipated production capacity of the project and a description of the production processes to be used, the associated infrastructure and any permanent or temporary structures.	Anticipated size or production capacity of the designated project, with reference to thresholds set out in the *Regulations Designating Physical Activities*, including a description of the production processes to be used, the associated infrastructure, and any permanent or temporary structures. The production capacity does not refer to the planned production capacity of a project, but the maximum production capacity based on the project's design and operating conditions	2.2
	2.3.3		If the designated project or one component of the designated project is an expansion, describe the size and nature of the expansion with reference to the thresholds set out in the *Regulations Designating Physical Activities.*	Not Applicable

Regulation Clause	Guideline Section	Regulation SOR 2012-148 Requirement	Guidance to Support Regulation Requirement	Project Description Section(s)
9	2.3.4	A description of all activities to be performed in relation to the project.	A description of the physical activities that are incidental to the designated project. In determining such activities, the following criteria shall be taken into account: • nature of the proposed activities and whether they are subordinate or complementary to the designated project; • whether the activity is within the care and control of the proponent; • if the activity is to be undertaken by a third party, the nature of the relationship between the proponent and the third party and whether the proponent has the ability to "direct or influence" the carrying out of the activity; • whether the activity is solely for the benefit of the proponent or is available for other proponents as well; and • the federal and/or provincial regulatory requirements for the activity.	2.2
10	2.4	A description of any waste that is likely to be generated during any phase of the project and of a plan to manage that waste.	Provide a description of any waste likely to be generated during any phase of the designated project and plans to manage that waste, including the following: Sources of atmospheric contaminant emissions during the designated project phases (focusing on criteria air contaminants and greenhouse gases, or other non-criteria contaminants that are of potential concern) and location of emissions. Sources and location of liquid discharges. Types of wastes and plans for their disposal (e.g., landfill, licensed waste management facility, marine waters, or tailings containment facility).	2.3

Regulation Clause	Guideline Section	Regulation SOR 2012-148 Requirement	Guidance to Support Regulation Requirement	Project Description Section(s)
11	2.5	A description of the anticipated phases of and the schedule for the Project's construction, operation, decommissioning, and abandonment.	Provide a description of the timeframe in which the development is to occur and the key project phases, including the following: Anticipated scheduling, duration and staging of key project phases, including preparation of the site, construction, operation, and decommissioning and abandonment. Main activities in each phase of the designated project that are expected to be required to carry out the proposed development (e.g., activities during site preparation or construction might include, but are not limited to, land clearing, excavating, grading, de-watering, directional drilling, dredging and disposal of dredged sediments, infilling, and installing structures).	2.2, 2.4
Project Location				
12	3.0	A description of the Project's location, including:	A description of the designated project's location, including:	2.1
12(a)	3.1.1	Geographic coordinates;	Coordinates (i.e. longitude/latitude using international standard representation in degrees, minutes, seconds) for the centre of the facility or, for a linear project, provide the beginning and end points	2.1; Table 2.1 and 2.2
12(b)	3.1.2, 3.1.3	Site maps produced at an appropriate scale in order to determine the project's overall location and the spatial relationship of the project components;	Site map/plan(s) depicting location of the designated project components and activities. The map/plan(s) should be at an appropriate scale to help determine the relative size of the proposed components and activities.	2.1, Figure 2-1
			Map(s) at an appropriate scale showing the location of the designated project components and activities relative to existing features, including but not limited to:	
			watercourses and waterbodies with names where they are known;	Figure 2-1
			linear and other transportation components (e.g., airports, ports, railways, roads, electrical power transmission lines and pipelines);	Figures 3-8 and 3-10
			other features of existing or past land use (e.g., archaeological sites, commercial development, houses, industrial facilities, residential areas and any waterborne structures);	Figures 3-1 to 3-10

Regulation Clause	Guideline Section	Regulation SOR 2012-148 Requirement	Guidance to Support Regulation Requirement	Project Description Section(s)
			location of Aboriginal groups, settlement land (under a land claim agreement) and, if available, traditional territory;	Figures 3-5 and 3-6
			federal lands including, but not limited to National parks, National historic sites, and reserve lands;	Figures 3-1
			nearby communities;	Figure 3-5 and 3-6
			permanent, seasonal or temporary residences;	Section 2.1
			fisheries and fishing areas (i.e., Aboriginal, commercial and recreational);	Section 3.3.1, Figure 3-4
			environmentally sensitive areas (e.g., wetlands, and protected areas, including migratory bird sanctuary reserves, marine protected areas, National Wildlife areas, and priority ecosystems as defined by Environment Canada);	Section 3.2.5 and Figures 3-1, 3-2 and 3-3
			provincial and international boundaries.	Figure 2-1
	3.1.4		Photographs of work locations to the extent possible.	N/A
12(c)	3.2	The legal description of land to be used for the project, including the title, deed or document and any authorization relating to a water lot;	To the extent that is known at this time, describe the ownership and zoning of land and water that may be affected by the project, including the following: zoning designations.	2.1
			legal description of land to be used (including information on subsurface rights) for the designated project, including the title, deed or document and any authorization relating to a water lot.	1.1, 2.1
12(d)	3.1.5	The project's proximity to: any permanent, seasonal or temporary residences;	Proximity of the designated project to: any permanent, seasonal or temporary residences;	2.1, 3.3.2
12(e)	3.1.5	traditional territories as well as lands and resources currently used for traditional purposes by Aboriginal peoples;	traditional territories, settlement land (under a land claim agreement) as well as lands and resources currently used for traditional purposes by Aboriginal peoples; and	3.3.2

Regulation Clause	Guideline Section	Regulation SOR 2012-148 Requirement	Guidance to Support Regulation Requirement	Project Description Section(s)
12(f)	3.1.5	any federal lands.	any federal lands.	1.3.3, 2.1
	3.2.3		Any applicable land use, water use (including ground water), resource management or conservation plans applicable to or near the project site. Include information on whether such plans were subject to public consultation.	3.2.5
	3.2.4		Describe whether the designated project is going to require access to, use or occupation of, or the exploration, development and production of lands and resources currently used for traditional purposes by Aboriginal peoples.	3.3.2, 5.1
Federal Involvement				
13	4.1	A description of any financial support that federal authorities are, or may be, providing to the project.	Describe if there is any proposed or anticipated federal financial support that federal authorities are, or may be, providing to support the carrying out of the designated project.	1.3.3
14	4.2	A description of any federal land that may be used for the purpose of carrying out the project.	Describe any federal lands that may be used for the purpose of carrying out the designated project. This is to include any information on any granting of interest in federal land (i.e., easement, right of way, or transfer of ownership).	2.1
15	4.3	A list of the permits, licences or other authorizations that may be required under any Act of Parliament to carry out the project.	Provide a list of any federal permits, licences or other authorizations that may be required to carry out the project.	1.3.3
Environmental Effects				
16	5.1	A description of the physical and biological setting.	A description of the physical and biological setting, including the physical and biological components in the area that may be adversely affected by the project (e.g., air, fish, terrain, vegetation, water, wildlife, including migratory birds, and known habitat use).	3.1, 3.2

Regulation Clause	Guideline Section	Regulation SOR 2012-148 Requirement	Guidance to Support Regulation Requirement	Project Description Section(s)
17 (a)	5.2	A description of any changes that may be caused, as a result of carrying out the project, to fish as defined in section 2 of the *Fisheries Act* and fish habitat as defined in subsection 34(1) of that Act	A description of any changes that may be caused as a result of carrying out the designated project to: fish and fish habitat, as defined in the *Fisheries Act;* marine plants, as defined in the *Fisheries Act*;	5.1, 5.2
17(b)		aquatic species, as defined in subsection 2(1) of the Species at Risk Act		5.1, 5.2
17(c)	5.2	migratory birds, as defined in subsection 2(1) of the *Migratory Birds Convention Act, 1994*	migratory birds, as defined in the *Migratory Birds Convention Act*, *1994*	5.1, 5.2
18	5.3	A description of any changes to the environment that may occur, as a result of carrying out the project, on federal lands, in a province other than the province in which the project is proposed to be carried out or outside of Canada.	A description of any changes to the environment that may occur, as a result of carrying out the designated project, on federal lands, in a province other than the province in which the project is proposed to be carried out, or outside of Canada	5.1, 5.2
19	5.4	Information on the effects on Aboriginal peoples of any changes to the environment that may be caused as a result of carrying out the project, including effects on health and socio-economic conditions, physical and cultural heritage, the current use of lands and resources for traditional purposes or on any structure, site or thing that is of historical, archaeological, paleontological or architectural significance.	A description of the effects on Aboriginal peoples of any changes to the environment that may be caused as a result of carrying out the designated project, including effects on health and socio-economic conditions, physical and cultural heritage, the current use of lands and resources for traditional purposes, or any structure, site or thing that is of historical, archaeological, paleontological or architectural significance.	5.1, 5.2

Regulation Clause	Guideline Section	Regulation SOR 2012-148 Requirement	Guidance to Support Regulation Requirement	Project Description Section(s)
Proponent Engagement and Consultation with Aboriginal Groups				
	6.1		A list of Aboriginal groups that may be interested in, or potentially affected by, the designated project.	3.3.2, 4.1
	6.2		A description of the engagement or consultation activities carried out to date with Aboriginal groups, including:	4.1, 4.3
	6.2		names of Aboriginal groups engaged or consulted to date with regard to the designated project;	4.1, 4.3
	6.2		date(s) each Aboriginal group was engaged or consulted; and	4.1, 4.3
	6.2		means of engagement or consultation (e.g., community meetings, mail or telephone).	4
	6.3		An overview of key comments and concerns expressed by Aboriginal groups identified or engaged to date, including any responses provided to these groups.	4.1, 4.3
	6.4		A consultation and information-gathering plan that outlines the ongoing and proposed Aboriginal engagement or consultation activities, the general schedule for these activities and the type of information to be collected (or, alternatively, an indication of why such engagement or consultation is not required).	4.1
	6.4		The proponent is encouraged to provide background information on Aboriginal groups' potential or established Aboriginal or treaty rights. The proponent is also encouraged to provide information on the impact area of the designated project and how it overlaps with uses by Aboriginal groups that have potential or established Aboriginal or treaty rights.	3.3.2
Consultation with the Public and Other Parties (other than Aboriginal Consultation Included Above)				
	7.1		An overview of key comments and concerns expressed to date by stakeholders and any responses that have been provided.	4.3
	7.2		An overview of any ongoing or proposed stakeholder consultation activities.	4.2, 4.3

Regulation Clause	Guideline Section	Regulation SOR 2012-148 Requirement	Guidance to Support Regulation Requirement	Project Description Section(s)
	7.3		A description of any consultations that have occurred with other jurisdictions that have environmental assessment or regulatory decisions to make with respect to the project.	4.2
Summary				
20	8.0	Summary of the information required under section 1 to 19	Proponents are to include as part of the project description an executive summary that summarizes the information identified in Sections 1 to 7 of [the] Guide. Under CEAA 2012, the Agency is required to consult the public on a summary of the project description that has to be posted on the Agency's Internet site in both of Canada's official languages as required under the *Official Languages Act*. As a result, in order to be in a position to initiate the screening phase in a timely manner, the executive summary is to be prepared and submitted to the Agency in both English and French.	Project Description Summary Document
